ABSTRACT

As the federally designated Metropolitan Planning Organization (MPO) for the Hampton Roads region, the Hampton Roads Transportation Planning Organization (HRTPO) is required by federal legislation to develop and implement a Congestion Management Process (CMP) as an integrated part of the metropolitan transportation planning process. The Hampton Roads CMP is an on-going systematic process for managing congestion that provides information and analysis on multimodal transportation system performance and on strategies to alleviate congestion and enhance the mobility of persons and goods regionwide. During this process, HRTPO works with many stakeholders to develop these strategies and mobility options.

This Congestion Management Process Report is being released in three parts. This report – Part II – highlights System Performance. Part I of the study included the Introduction and information on System Monitoring, and Part III will detail Congestion Mitigation strategies.

ACKNOWLEDGMENTS

Prepared in cooperation with the U.S. Department of Transportation (USDOT), Federal Highway Administration (FHWA), and Virginia Department of Transportation (VDOT). The contents of this report reflect the views of the Hampton Roads Transportation Planning Organization (HRTPO). The HRTPO is responsible for the facts and the accuracy of the data presented herein. The contents do not necessarily reflect the official views or policies of the FHWA, VDOT or Hampton Roads Planning District Commission. This report does not constitute a standard, specification, or regulation. FHWA or VDOT acceptance of this report as evidence of fulfillment of the objectives of this planning study does not constitute endorsement/approval of the need for any recommended improvements nor does it constitute approval of their location and design or a commitment to fund any such improvements. Additional project level environmental impact assessments and/or studies of alternatives may be necessary.

NON-DISCRIMINATION

The HRTPO assures that no person shall, on the ground of race, color, national origin, handicap, sex, age, or income status as provided by Title VI of the Civil Rights Act of 1964 and subsequent authorities, be excluded from participation in, be denied the benefits of, or be otherwise subject to discrimination under any program or activity. The HRTPO Title VI Plan provides this assurance, information about HRTPO responsibilities, and a Discrimination Complaint Form.

INTRODUCTION

As the federally-designated Metropolitan Planning Organization (MPO) for the Hampton Roads region, the Hampton Roads Transportation Planning Organization (HRTPO) develops and implements a Congestion Management Process (CMP) as an integrated part of the metropolitan transportation planning process. The Hampton Roads CMP is an on-going systematic process for managing congestion that provides information and analysis on multimodal transportation system performance and on strategies to alleviate congestion and enhance the mobility of persons and goods regionwide. During this process, HRTPO works with many stakeholders to develop these strategies and mobility options.

This Congestion Management Process Report is being released in three parts. Part I of the study included the Introduction and focused on information related to System Monitoring. This report – Part II – highlights System Performance, and Part III will detail Congestion Mitigation strategies. More information on what is included in each of the three parts of the 2020 Congestion Management Process Report is shown in the box to the right.

As described in the CMP Elements section of Part I of this report, the Federal Highway Administration (FHWA) noted eight elements, or actions, that are common in successful CMPs. These actions include:

1. **Develop regional objectives for congestion management**
2. **Define the CMP network**
3. **Develop multimodal performance measures**
4. **Collect data/monitor system performance**
5. **Analyze congestion problems and needs**
6. **Identify and assess strategies**
7. **Program and implement strategies**
8. **Evaluate strategy effectiveness**

All eight of these elements are included in this CMP report and are highlighted with the numbers that correspond to the particular element.

CMP REPORT CONTENTS

PART I – INTRODUCTION AND SYSTEM MONITORING

1) **INTRODUCTION** – Contains information on Performance Management and Performance-Based Planning and Programming, the elements of a CMP, CMP goals and objectives, and how the CMP is incorporated into the regional transportation planning process.

2) **SYSTEM MONITORING** – Contains information on HRTPO's system monitoring efforts including the State of Transportation report, Annual Roadway Performance report, and regional performance measures and target setting. This section also includes information on regional roadway travel and trends, traffic volumes and characteristics at major bridges and tunnels, recently completed roadway projects, and the benefits of selected projects.

PART II – SYSTEM PERFORMANCE

3) **SYSTEM PERFORMANCE** – Includes a description of the CMP roadway network and the data used in this study, and the roadway congestion analysis.

4) **RANKING OF CMP CONGESTED CORRIDORS** – Includes a ranking of congested corridors throughout the region, and a description of the criteria used to produce the rankings.

PART III – CONGESTION MITIGATION

5) **FUTURE AND ONGOING ROADWAY PROJECTS** – Describes ongoing and upcoming planned and programmed projects included in both short-term and long-term planning documents.

6) **CONGESTION MITIGATION STRATEGIES** – Describes the tools and methods that have been and can be implemented to improve congested roadways.

7) **APPLICATION OF STRATEGIES TO CMP CONGESTED CORRIDORS** – Identifies causes of congestion and recommends improvements to the highest ranked congested freeways and arterial roadways.

8) **CONCLUSIONS/NEXT STEPS**

9) **PUBLIC INVOLVEMENT** – Describes HRTPO's public involvement efforts for this study.

SYSTEM PERFORMANCE

Part II of this Congestion Management Process report provides a thorough assessment of the current operating conditions of the Hampton Roads roadway system, particularly during peak periods of travel. The performance of roadway segments throughout the region are analyzed using travel time and speed data collected by INRIX and through a planning level analysis for roadways without this data. INRIX collects travel times and speeds on a continuous basis, which enables numerous congestion measures to be reported, such as average travel speeds, congestion duration, total delay, and travel time reliability.

Hampton Roads Bridge-Tunnel VDOT

The CMP congestion analysis is performed for the "Existing" roadway network as of the year 2018. The congestion identification analysis in this study is limited to roadway segments due to the data availability and reliability constraints of other transportation modes and facilities. The results of this analysis will enable the region to identify corridors that are experiencing severe congestion levels today and into the future.

2 CMP ROADWAY NETWORK

The roadways included in this congestion analysis are defined as the CMP Roadway Network. The CMP Roadway Network includes both 1) major roadways within the Hampton Roads Transportation Planning Organization (HRTPO) boundary, which is also referred to as the Hampton Roads Metropolitan Planning Area (MPA), and 2) major roadways in that portion of the Hampton Roads Planning District Commission (HRPDC) boundary outside of the Metropolitan Planning Area. Roadways in Surry County and the portions of the City of Franklin, Gloucester County, and Southampton County that are outside of the MPA were analyzed for this study as part of the Rural Transportation Planning Program. Although the roadways in these areas outside of the MPA were analyzed, **regional roadway and congestion statistics within this report only reflect the CMP Roadway Network within the Metropolitan Planning Area**.

The CMP Roadway Network includes all roadways in Hampton Roads that are classified as interstates, freeways or other expressways, principal arterials, and minor arterials. The CMP Roadway Network also includes several roadways classified as collectors. These collectors were chosen for inclusion in the CMP Roadway Network based on network connectivity, access to major activity centers, importance to the military, and input from localities.

A few changes were made to the CMP Roadway Network since the 2014 version of the CMP report. New roadways have been added to the network, and segment endpoints in some cases were adjusted. Existing roadways added to the CMP Roadway Network since the previous CMP update are:

- 25th Street - Huntington Avenue to Warwick Boulevard in Newport News
- Atlantic Avenue - Fort Story to 83rd Street in Virginia Beach
- Cape View Avenue - Bayview Boulevard to Ocean View Avenue in Norfolk
- Cleveland Street/Columbus Street - Witchduck Road to Independence Boulevard in Virginia Beach
- Dominion Boulevard - Cedar Road to Chesapeake Expressway in Chesapeake (this facility was converted from an arterial to a freeway)
- Semple Farm Road - Big Bethel Road to Magruder Boulevard

The CMP Roadway Network has also expanded due to new roadways being opened and roadway widening projects being completed since the 2014 CMP report. These roadways include:

- City Center Boulevard - Warwick Boulevard to Jefferson Avenue in Newport News
- Lynnhaven Parkway - Centerville Turnpike to Indian River Road in Virginia Beach
- MLK Freeway Extension - I-264 to High Street in Portsmouth
- Nimmo Parkway - Holland Road to General Booth Boulevard in Virginia Beach
- Seaboard Road - North Landing Road to Nimmo Parkway in Virginia Beach

With these additions, the entire existing CMP Roadway Network (as of the end of 2018) is comprised of 1,608 centerline-miles and 5,521 lane-miles of roadway. Excluding areas outside of the Metropolitan Planning Area, the CMP Roadway Network includes 1,410 centerline-miles and 4,991 lane-miles of roadway, up from 1,382 centerline-miles and 4,879 lane-miles of roadway in the 2014 CMP Roadway Network.

In addition to existing facilities, major roadways that are expected to be constructed in the future are also included in the CMP Roadway Network. These roadways, which are included in the 2040 Hampton Roads Long-Range Transportation Plan, will be described in more detail in the Future and Ongoing Roadway Projects section in Part III of this report.

Monitor Merrimac Mem. Bridge-Tunnel VDOT

4 DATA

A large amount of data is analyzed as part of this study including recent traffic volumes, roadway characteristic data, future traffic volume estimates, and historical travel time and speed data.

The traffic volume and roadway characteristic data used in this study was largely obtained from VDOT. VDOT collects vehicle count data for more than 100,000 roadway segments throughout the state – and over 8,000 locations in Hampton Roads – as part of its Traffic Monitoring Program. Data is collected on all roadways classified as minor collectors or above once every three years for a 48-hour period. Data from the years 2016-2018 was used in this study to determine the "Existing" weekday volumes.

In addition to VDOT's data, traffic volume data collected by other sources throughout the region are used in this study. The Cities of Hampton, Newport News, Suffolk, and Virginia Beach maintain traffic data collection programs. All five tunnels in the region, the South Norfolk Jordan Bridge, the Veterans Bridge, and the Chesapeake Expressway also collect volume data as part of daily operations.

For the limited number of roadways where traffic volumes were not available from these sources, daily volumes were estimated using Annual Average Daily Traffic (AADT) volumes produced by Streetlight Data, which is a data analytics firm that measures and estimates travel patterns by using over 4 trillion mobile location data points.

Existing and historical weekday traffic volumes for each roadway segment are included in **Appendix A**. HRTPO also documents traffic volume data in the *HRTPO Annual Roadway Performance Report*. This report is produced by HRTPO annually in those years when CMP reports are not published.

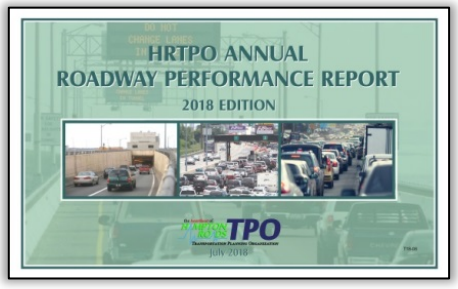

Future traffic volumes for the year 2040 were projected using the Hampton Roads Travel Demand Model. This model produces daily volumes based on projected socioeconomic conditions and the expected future roadway network. These volumes are included in the *Hampton Roads 2040 Long-Range Transportation Plan: Plan Performance* Appendix.

HRTPO staff has access to historical travel time and speed data collected by INRIX. INRIX collects travel time and speed data on a continuous basis, using millions of GPS-enabled fleet vehicles (such as service vehicles and long-haul trucks), vehicle navigation systems, mobile devices that have INRIX's real-time traffic applications installed, traditional road sensors, and many other sources.

VDOT has purchased real-time and archived travel time and speed data from INRIX. HRTPO staff can access this data through the Regional Integrated Transportation Information System (RITIS), which is maintained by the University of Maryland's Center for Advanced Transportation Technology Laboratory. The roadway network with INRIX data available in RITIS was expanded in late 2018. INRIX data is now available for 1,269 centerline miles of roadway in Hampton Roads, including nearly all freeways, principal arterials, and minor arterials. INRIX's coverage now comprises 79% of the centerline-miles and 86% of the lane-miles of the existing CMP Roadway Network, up from 69% and 77% respectively that was available for the 2014 CMP report.

HRTPO staff downloaded INRIX data for the CMP Roadway Network for the entire year of 2018. For roadways added to RITIS in late 2018, data from the first six months of 2019 was used. Data was obtained by direction for every 15-minute period on Tuesdays, Wednesdays, and Thursdays during the morning (AM) peak period (defined in this study as occurring between 5:00 am and 9:00 am) and the afternoon (PM) peak period (defined as occurring between 3:00 pm and 7:00 pm). This data was analyzed by HRTPO staff to produce yearly average speeds for each 15-minute interval during the AM and PM peak periods, which were used in the following congestion analysis.

Similar to traffic volumes, measures based on INRIX travel time data are also included in the *HRTPO Annual Roadway Performance Report*.

3.5 CONGESTION ANALYSIS

As stated in the previous section, INRIX data is available for 79% of the centerline-miles of the CMP Roadway Network for this analysis. The methodology used to analyze the CMP Roadway Network and the performance measures that are calculated depends on whether or not INRIX speed data is available for the roadway segment.

Roadways without Speed Data

For the 21% of the CMP Roadway Network where INRIX data is not available, AM and PM peak hour roadway congestion levels were determined using a widely accepted engineering standard from the *Highway Capacity Manual* (HCM)[1] called Level of Service (LOS). Level of Service is measured on a scale of "A" through "F," with LOS A representing the best operating conditions and LOS F representing the worst operating conditions (**Figure 1**). Levels of Service A through C are acceptable operating conditions that are considered to be "Low Congestion" levels. Level of Service D is considered to be an acceptable operating condition with "Moderate Congestion" levels, while Levels of Service E and F are considered to be unacceptable operating conditions with "Severe Congestion".

For those roadways without INRIX data, the CMP uses a planning level analysis to determine the "2018 Existing" LOS. The analysis uses a number of roadway factors and characteristics, such as daily volumes, number of lanes, signals per mile, median type, and peak hour traffic factors. This planning level analysis is more detailed than using generalized tables with default values to calculate levels of service, but is not as detailed as an operational analysis which would include factors such as intersection signal timings, turn bay lengths, and turning movement counts at intersections.

Congestion levels for CMP roadways without INRIX speed data were calculated for both the AM Peak Period and PM Peak Period using the most recent weekday traffic volume data that was available (generally from 2016 – 2018). This "2018 Existing" LOS analysis was done using LOS software[2] produced by the Florida Department of Transportation. The LOSPLAN software uses HCM methods to calculate congestion levels based on various roadway and traffic characteristics. Congestion levels for each roadway segment were determined for the hour with the highest traffic volume during the AM Peak Period (which is defined as the highest volume of weekday traffic in four consecutive 15-minute periods between 5 am and 9 am) and the PM Peak Period (between 3 pm and 7 pm).

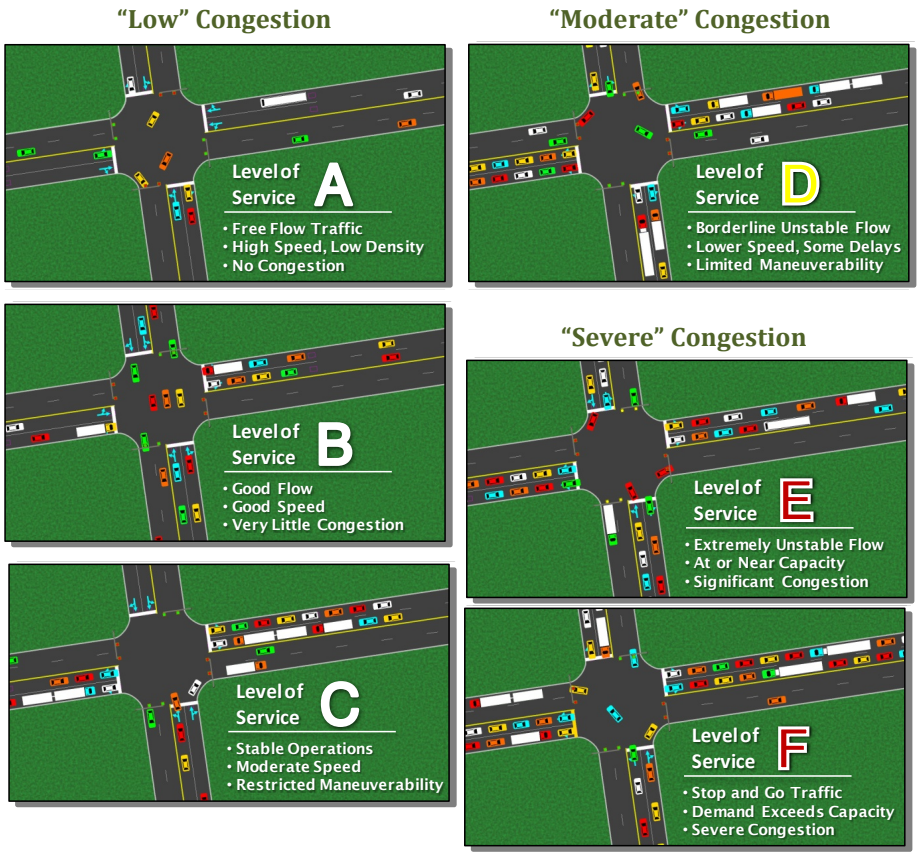

Figure 1 – Level of Service Definitions Simulation Source: Synchro/SimTraffic 7

[1] *Highway Capacity Manual, 6th Edition*, Transportation Research Board, 2016

[2] LOSPLAN Software, Florida Department of Transportation, 2012

This planning level analysis was also used to project future (2040) travel conditions for all CMP roadways as part of the 2040 Hampton Roads Long-Range Transportation Plan (LRTP). Future congestion levels were determined using the volumes and improvement projects contained in the 2040 LRTP, which is described further in Part III of this report.

Congestion Level		Freeway	Arterial
Low	LOW	TTI < 1.15	TTI < 1.25
Moderate	MOD	1.15 ≤ TTI < 1.30	1.25 ≤ TTI < 1.40
Severe	SEV	TTI ≥ 1.30	TTI ≥ 1.40

Figure 2 – Congestion Level Thresholds
Source: HRTPO.

Roadways with Speed Data

A number of congestion-related measures can be calculated using INRIX travel time and speed data that could only be estimated in previous CMPs. These measures include:

- Congestion levels based on actual travel speeds rather than HCM estimation methods
- Duration of congestion
- Total delay
- Travel time reliability

This section specifically describes measuring congestion levels using INRIX speed data. Information regarding congestion duration, total delay, and travel time reliability methodologies is included in the subsequent sections.

HRTPO staff used the travel time index (TTI) to determine the level of congestion on CMP Roadway Network segments with INRIX speed data available. The travel time index is a measure that reflects how travelers perceive the travel time and congestion level of the roadway. The TTI compares typical travel conditions during a particular time of day (usually the peak travel hour or period) to the travel conditions during uncongested, or free-flow, conditions.

The travel time index is calculated using the following equation:

$$\text{Travel Time Index (TTI)} = \frac{\text{Average Travel Time}}{\text{Free-flow Travel Time}}$$

As an example, if it takes one minute to travel the length of a roadway segment during uncongested, free-flow conditions but it takes two minutes on average during congested peak period conditions, the travel time index of the roadway segment would be 2 minutes/1 minute = 2.0.

INRIX data allows for the calculation of congestion levels via the travel time index regardless of the severity of congestion on the roadway. This differs from a Highway Capacity Manual Level-of-Service analysis, which has a peak of Level of Service of F. Those roadway segments with the highest travel time indices are the segments that are the most congested.

HRTPO staff calculated the travel time index for each CMP Roadway Network segment by direction for each 15-minute interval during the AM and PM Peak Periods based on the 2018 INRIX speed data. The highest 15-minute travel time index during the AM Peak Period (defined in this study as occurring between 5:00 am and 9:00 am) and the PM Peak Period (defined as occurring between 3:00 pm and 7:00 pm) was used to determine each roadway segment's peak period congestion level.

Each roadway segment was classified as having a "low", "moderate", or "severe" level of peak period congestion based on this highest travel time index, using the thresholds shown above in **Figure 2**. Low congestion levels are comparable to a Highway Capacity Manual Level of Service of A, B or C, as described on the previous page. Moderate congestion levels are comparable to a Level of Service D, and severe congestion levels are comparable to a Level of Service of E or F.

Roadway Congestion Levels

HRTPO staff determined the 2018 Existing congestion levels for roadways with INRIX speed data available based on the travel time index, and Highway Capacity Manual methodology for roadways without INRIX data as described previously.

Maps 1-2 on pages 8-9 show the existing congestion levels during the AM Peak Period for the Peninsula and the Southside, and **Maps 3-4** on pages 10-11 show the existing congestion levels during the PM Peak Period. Existing AM and PM Peak Period congestion levels for each roadway segment are also listed for each roadway segment in **Appendix B** and shown on maps in **Appendix E**.

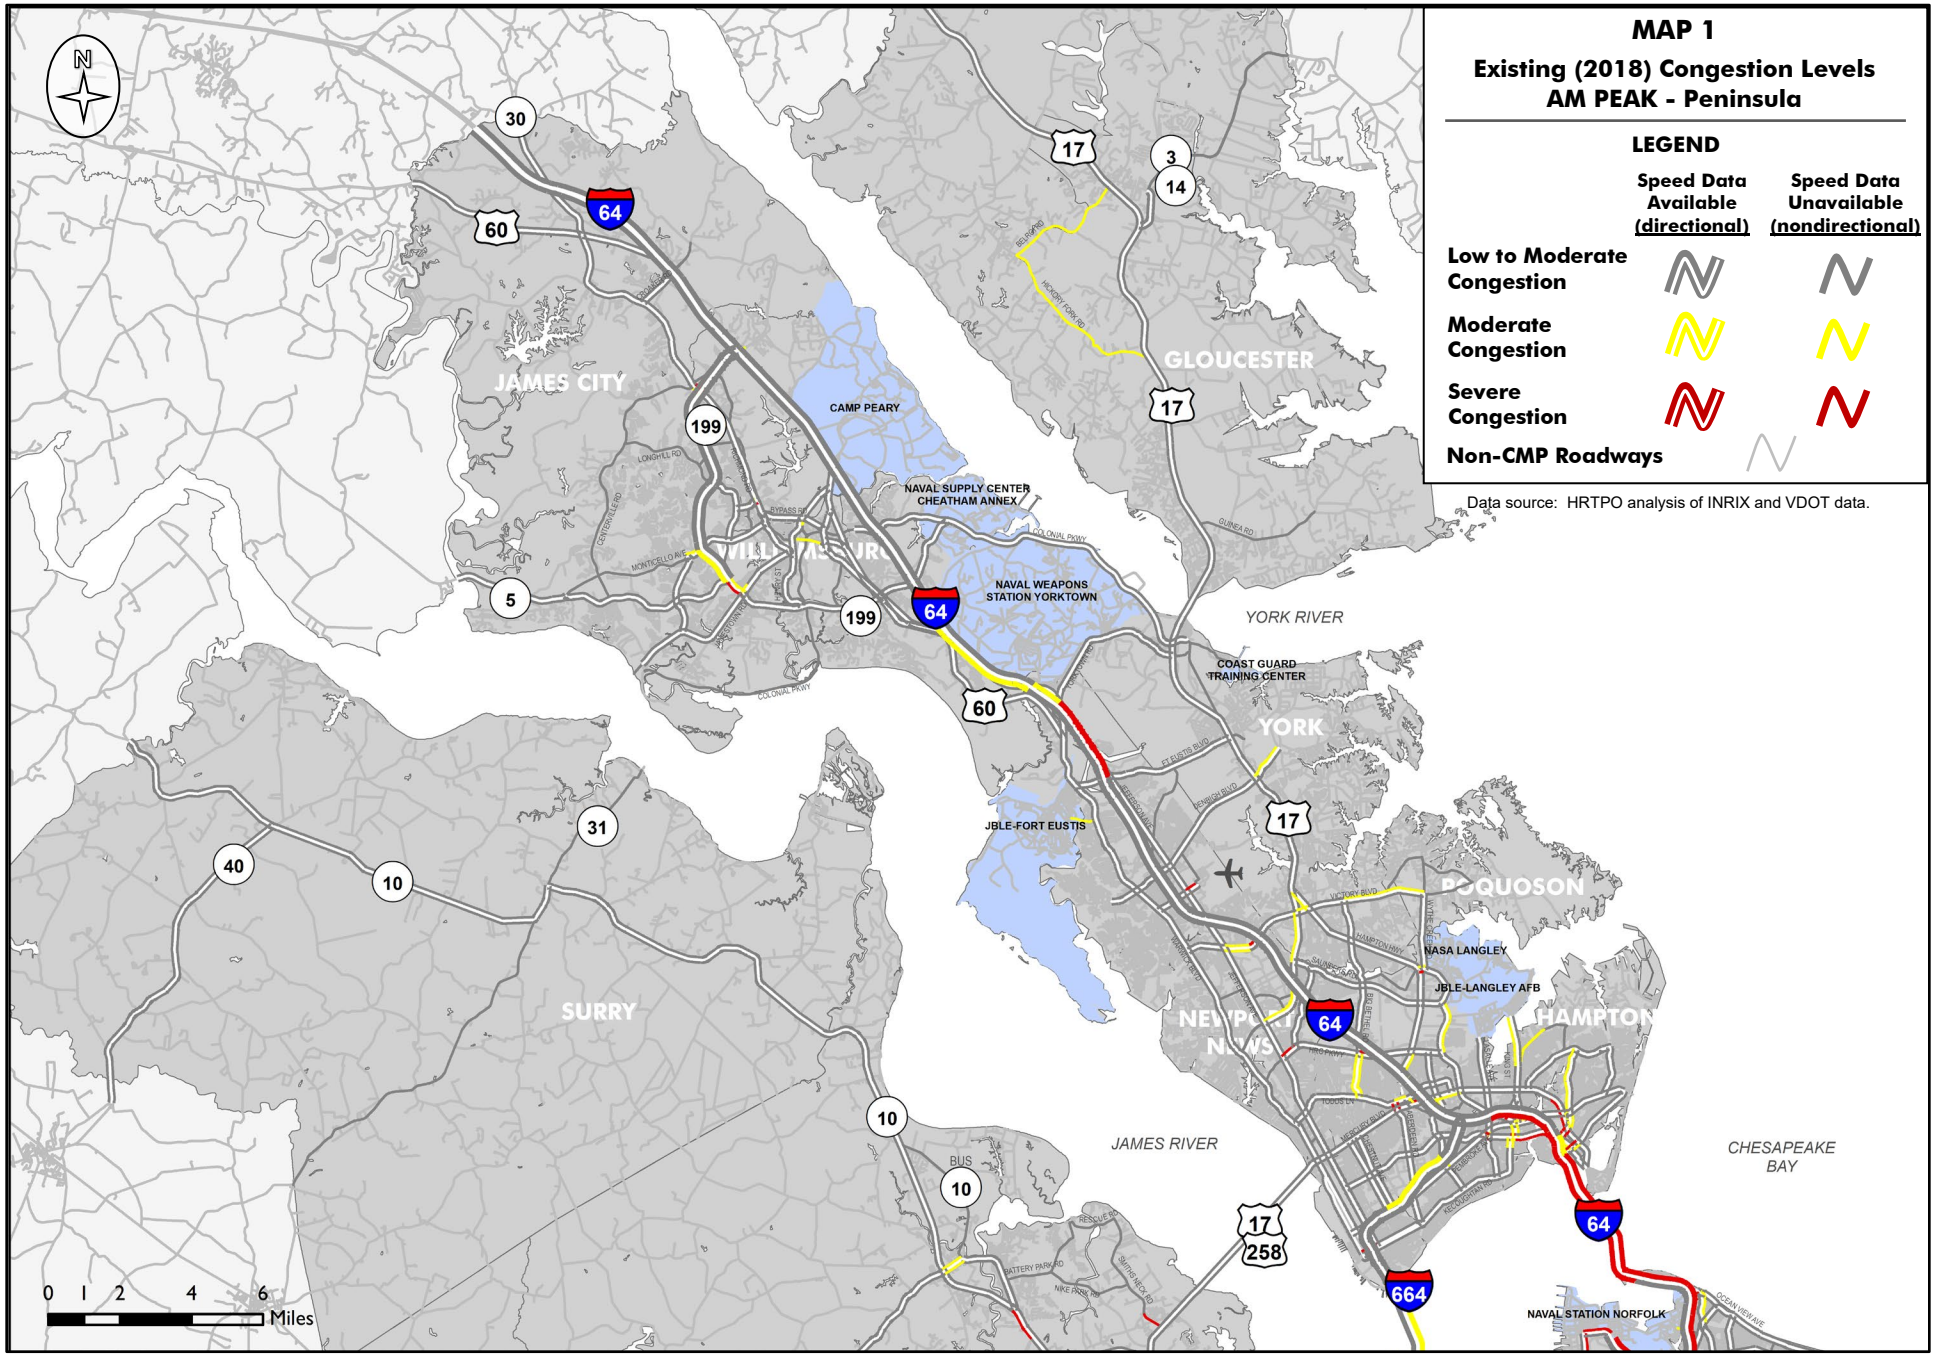

Figure 3 on page 12 shows the top 25 freeway segments and top 25 arterial segments with INRIX data in terms of highest travel time indices during the AM Peak Period. Eighteen of the top 25 most congested freeway segments are at or on approaches to the Downtown Tunnel, Hampton Roads Bridge-Tunnel, Midtown Tunnel, High Rise Bridge, or I-64/I-264 Interchange. In terms of arterials, the segments with the highest travel time indices during the AM Peak Period include Berkley Avenue approaching the Downtown Tunnel, George Washington Highway near the Norfolk Naval Shipyard in Portsmouth, Mallory Street approaching the Hampton Roads Bridge-Tunnel, Tidewater Drive near Downtown Norfolk, Route 60 at Route 199 in James City County, and Effingham Street approaching the Portsmouth Naval Medical Center.

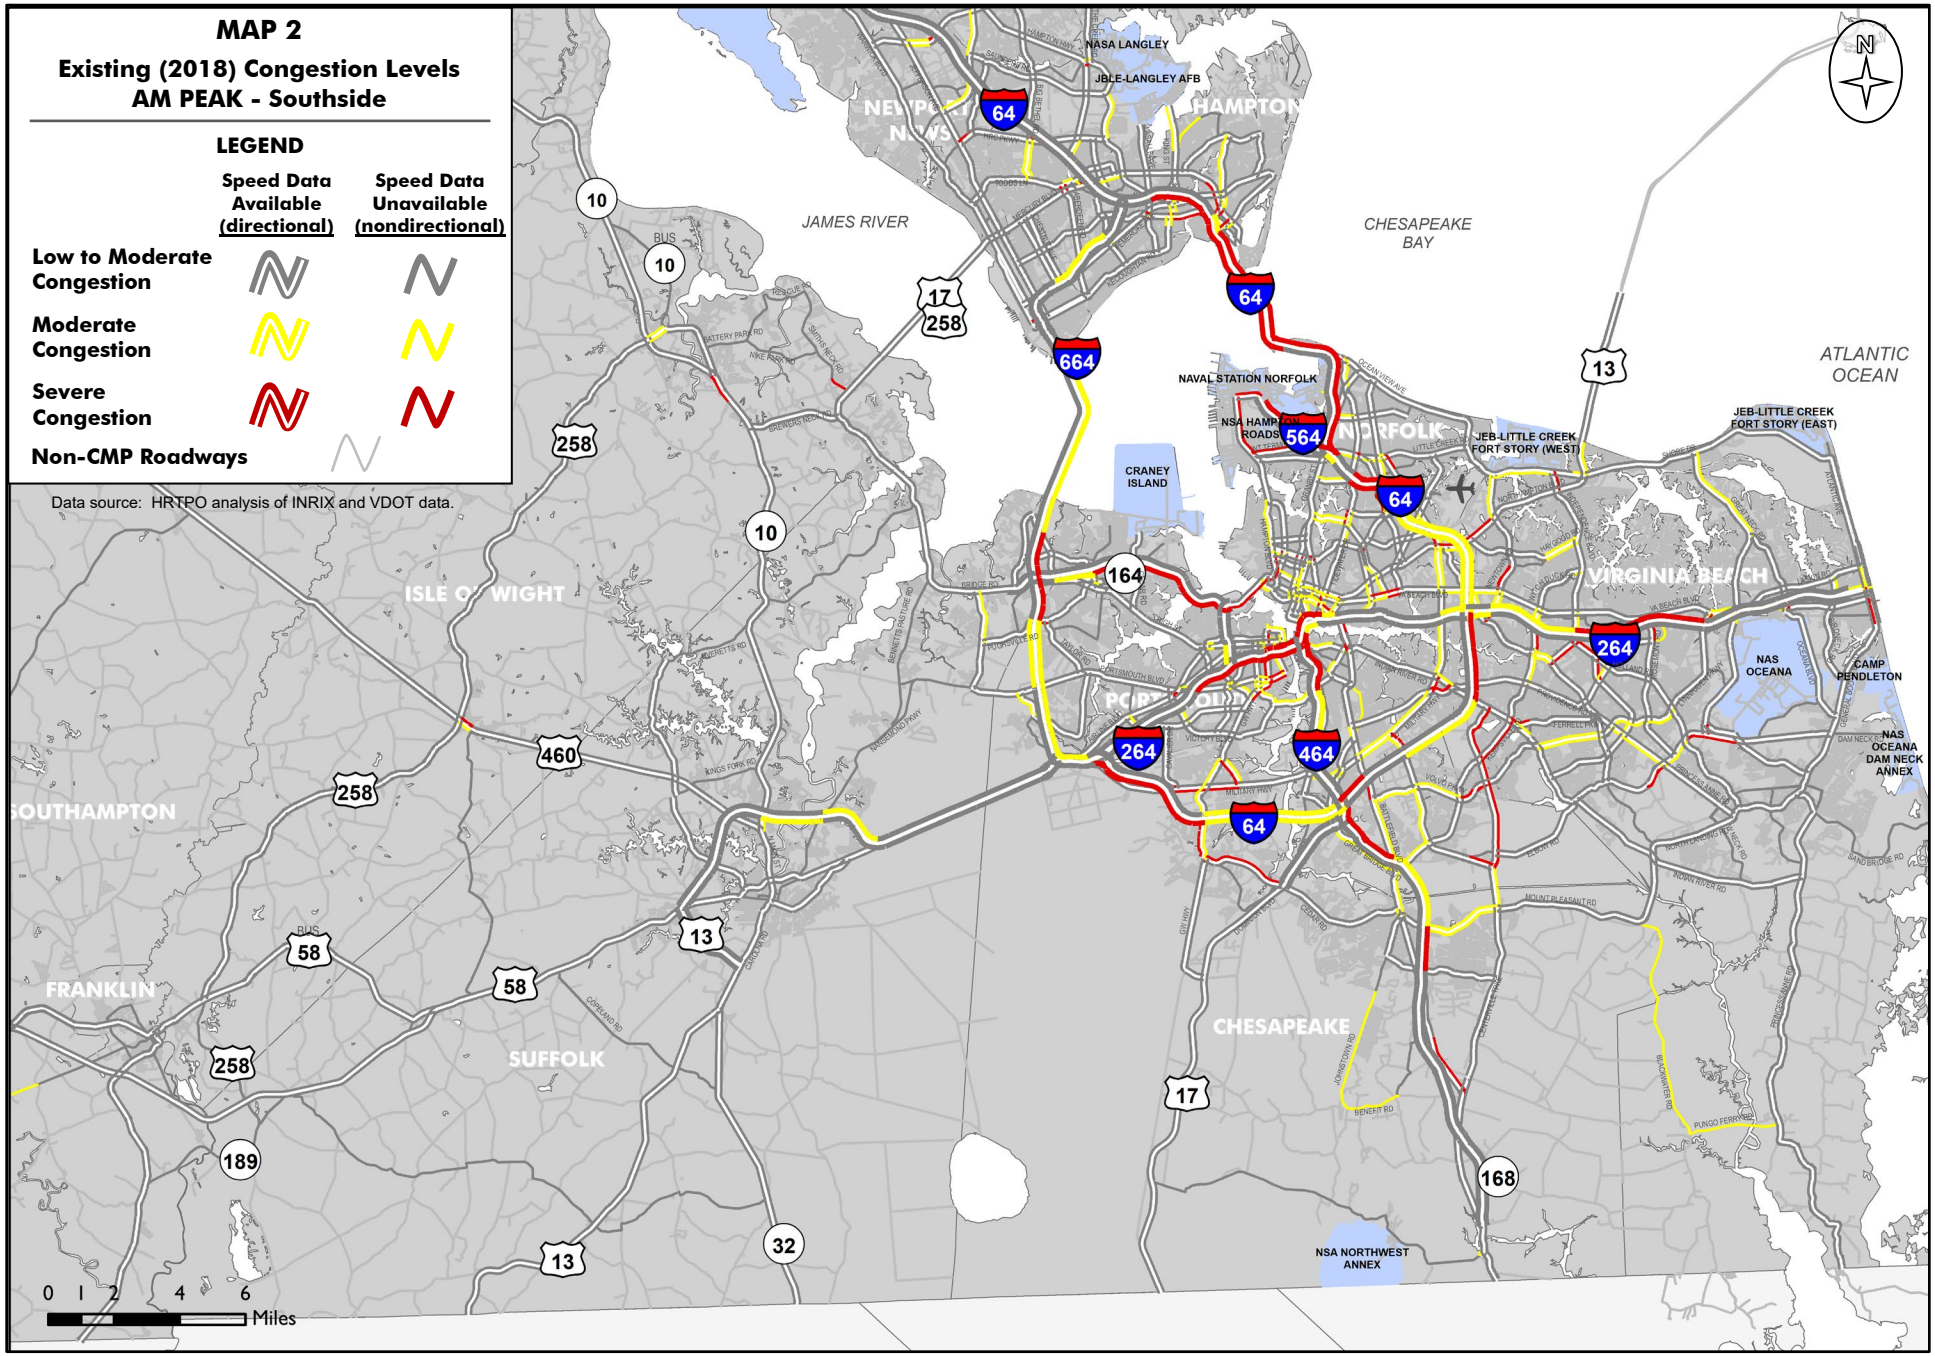

Figure 4 on page 13 shows the top 25 freeway segments and top 25 arterial segments in terms of highest travel time indices during the PM Peak Period. All but three of the top 25 freeway segments with the highest travel time indices during the PM Peak Period are at or approaching high profile locations including the Downtown Tunnel, Hampton Roads Bridge-Tunnel, Monitor-Merrimac Memorial Bridge-Tunnel, High Rise Bridge, or I-64/I-264 Interchange.

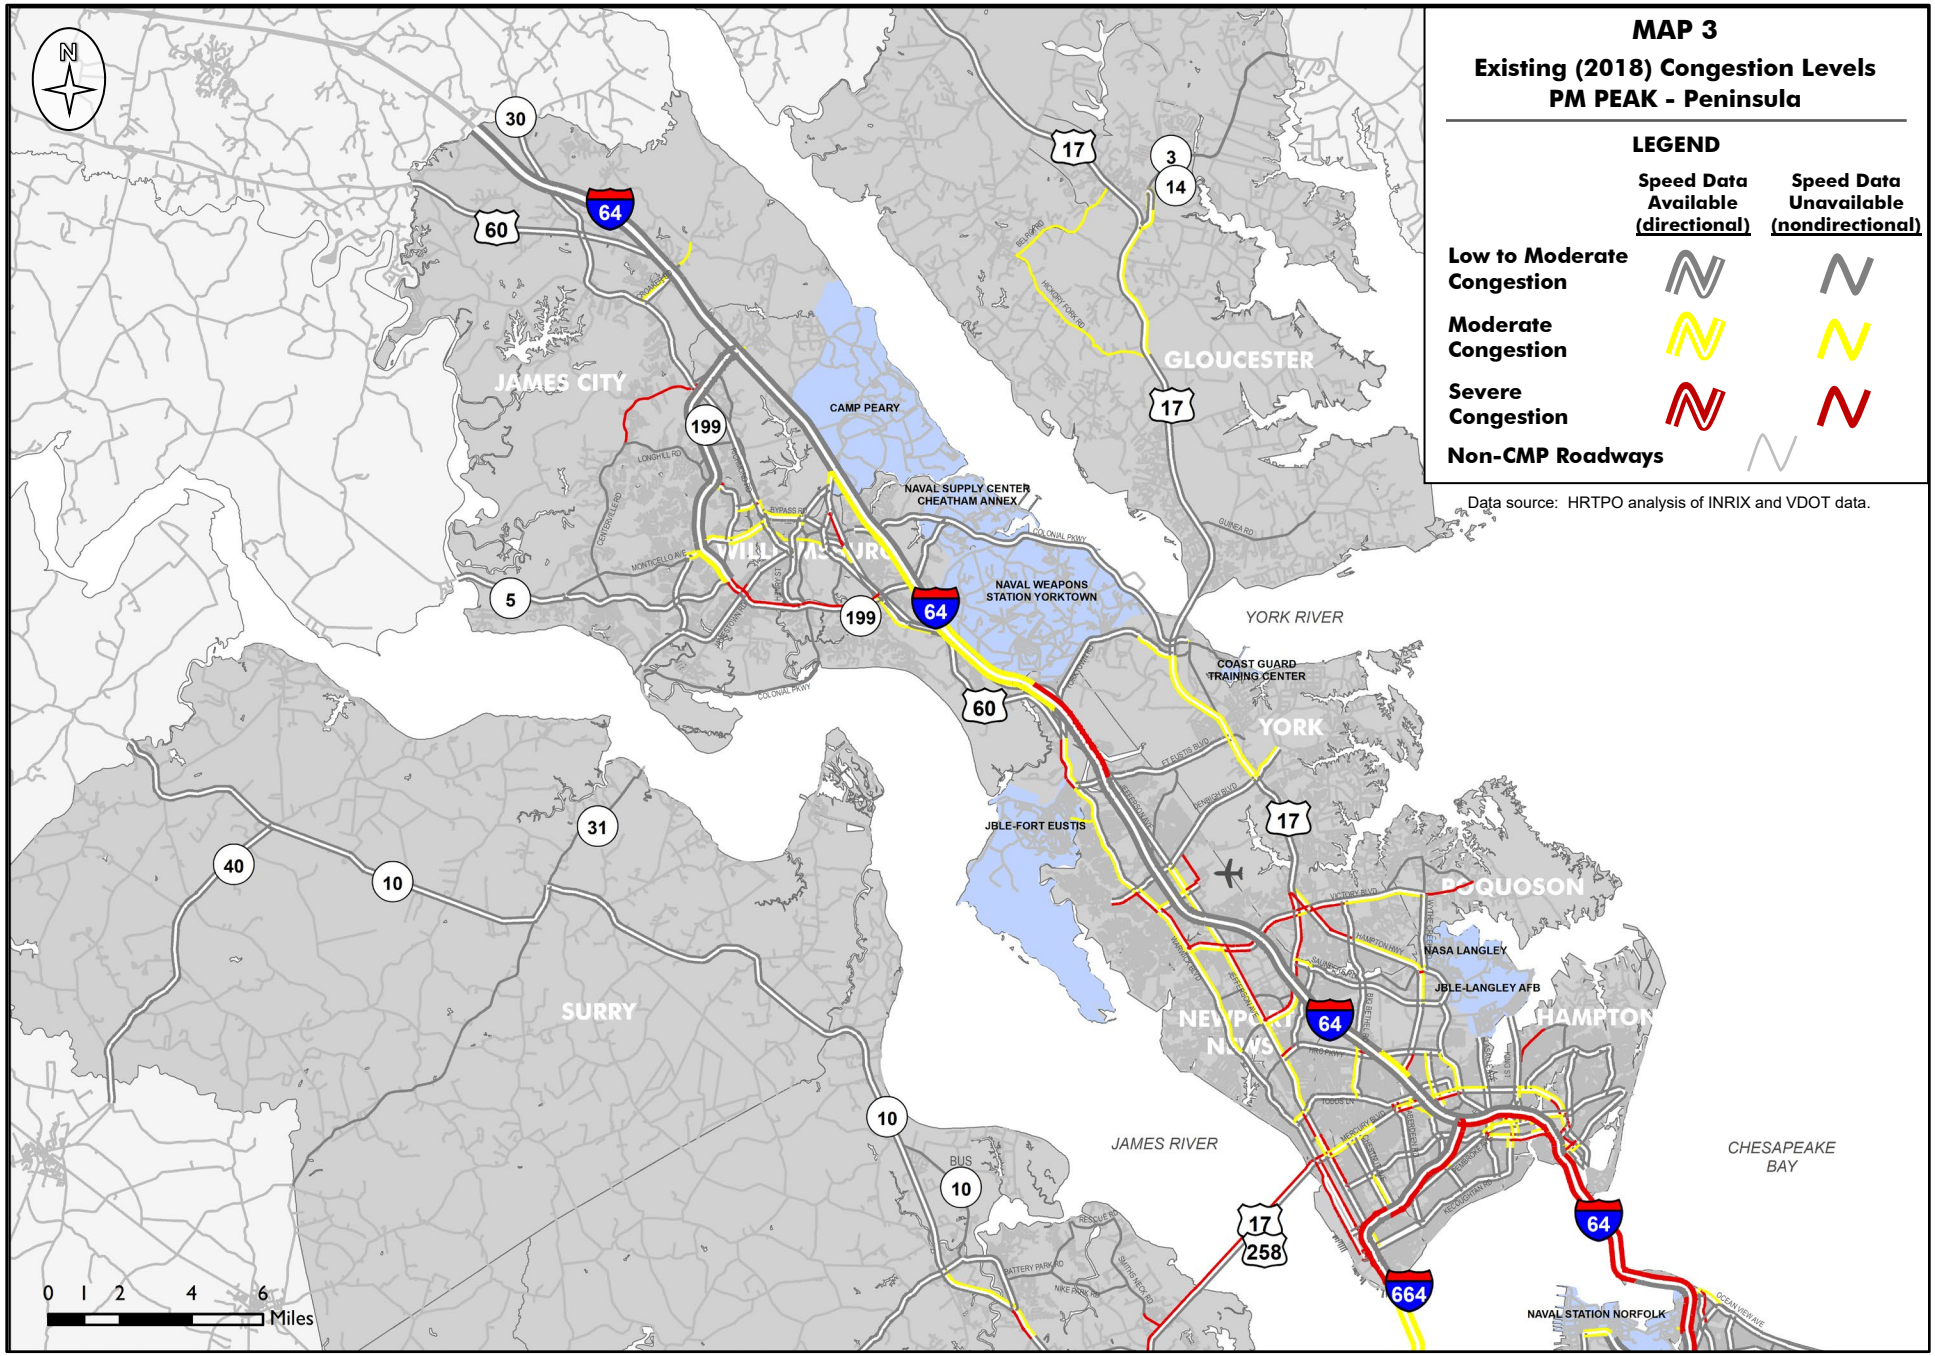

The top four most congested arterial segments during the PM Peak Period are Fourth View Street, Mallory Street, Settlers Landing Road, and Woodland Road, all of which are approaches to the Hampton Roads Bridge-Tunnel. Each of these segments have travel time indices greater than 2.8, meaning average travel times are nearly three times or more longer during congested conditions than during uncongested, free-flow conditions. The other arterial roadways with the highest travel time indices in the PM Peak Period include Battlefield Boulevard near I-64, Dam Neck Road, Indian River Road east of I-64, and Military Highway approaching the Gilmerton Bridge from the east.

Source: HRTPO analysis of INRIX data. The travel time index compares typical travel conditions during a particular time of day to the travel conditions during uncongested, or free-flow, conditions. Travel Time Index = Average Travel Time/Free-flow Travel Time

The following abbreviations are used for high profile locations:
DT = I-264/Downtown Tunnel GILM = US 13/Gilmerton Bridge HIGH RISE = I-64 corridor in Chesapeake HRBT = I-64/Hampton Roads Bridge-Tunnel
I-64/I-264 = I-64/I-264 interchange area in Norfolk MMMBT = I-664/Monitor-Merrimac Mem. Bridge-Tunnel MT = US 58/Midtown Tunnel

Regional Congestion Levels

Existing Congestion Levels

HRTPO staff used the roadway segment congestion analysis to calculate existing congestion levels on a regional basis[3]. As shown in **Figure 5**, 275 of the 4,991 lane-miles[4] (6%) in the Hampton Roads CMP Roadway Network currently operate under severely congested conditions during the AM Peak Period. Another 520 lane-miles (10%) operate under acceptable but moderately congested conditions, while the remaining 4,196 lane-miles (84%) have low levels of congestion.

A much higher percentage of the CMP Roadway Network is congested during the PM Peak Period than during the AM Peak Period. A total of 687 of the 4,991 lane-miles (14%) currently operate under severely congested conditions during the PM Peak Period. Another 711 lane-miles (14%) operate under moderately congested conditions, and the remaining 3,593 lane-miles (72%) are roadways that operate with low levels of congestion.

In addition to analyzing regional congestion levels by lane-mile, which is a measure of the physical roadway system, HRTPO staff also analyzed regional congestion levels by daily vehicle-miles of travel[5], which is a measure of the total amount of travel. This measure better represents the congestion experienced by travelers throughout the region each weekday.

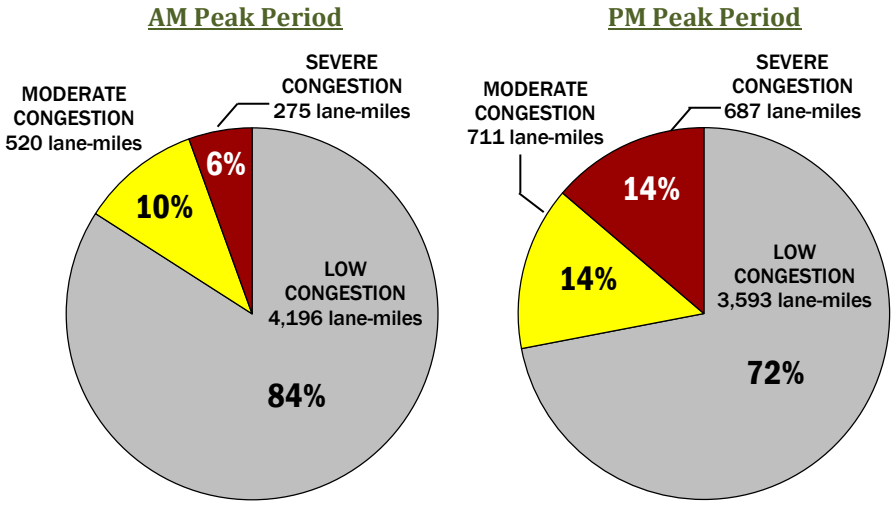

Figure 5 – Existing (2018) Congestion Levels by Lane-Mile for the CMP Roadway Network

Source: HRTPO analysis of INRIX and VDOT data.

Figure only include those CMP network roadways within the Hampton Roads MPA.

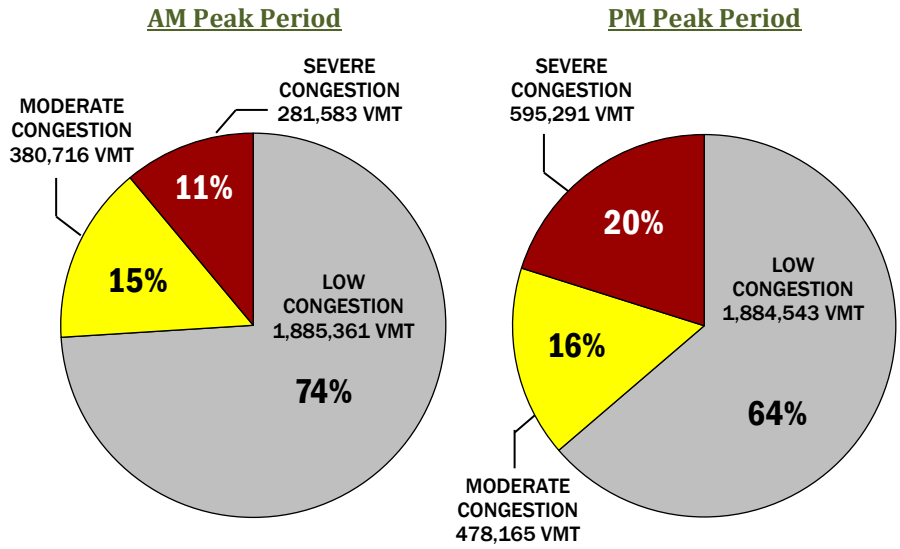

Figure 6 – Existing (2018) Congestion Levels by Vehicle-Miles of Travel for the CMP Roadway Network

Source: HRTPO analysis of INRIX and VDOT data.

Figure only include those CMP network roadways within the Hampton Roads MPA.

As shown in **Figure 6**, nearly 282,000 of the 2.55 million vehicle-miles of travel (11%) on the Hampton Roads CMP Roadway Network during the AM Peak Period each weekday currently occurs under severely congested conditions. Another 381,000 vehicle-miles of travel (15%) occurs under acceptable but moderately

[3] These regional congestion figures only include those roadways in the CMP Roadway Network within the Hampton Roads Metropolitan Planning Area (MPA) as defined on page 2.

[4] As an example, a roadway segment that is six lanes wide and one mile long comprises six lane-miles.

[5] As an example, ten vehicles that each travel one mile produce ten vehicle-miles of travel.

congested conditions, while the remaining vehicle-miles of travel (74%) have low levels of congestion.

Similar to lane-miles, a much higher percentage of travel on the CMP Roadway Network is congested during the PM Peak Period than during the AM Peak Period. A total of 595,000 of the 2.96 million vehicle-miles of travel (20%) during the PM Peak Period currently occurs under severely congested conditions. Another 478,000 vehicle-miles of travel (16%) occurs under moderately congested conditions, and the remaining vehicle-miles of travel (64%) occurs with low levels of congestion.

Figure 7 displays this roadway congestion data for each jurisdiction in Hampton Roads. During the AM Peak Period, the jurisdictions with the highest percentage of CMP Roadway Network lane-miles operating in severely congested conditions are Norfolk (12%, primarily due to backups on approaches to the Midtown and Downtown Tunnels), Portsmouth (11%), Hampton (8%, primarily due to backups on the approach to the Hampton Roads Bridge-Tunnel), Chesapeake (7%), and Virginia Beach (6%). During the PM Peak Period, the jurisdictions with the highest percentage of CMP Roadway Network lane-miles operating in severely congested conditions are Norfolk (28%), Poquoson (20%), Chesapeake (19%), Newport News (18%), Hampton (14%), and Virginia Beach (14%).

Future Congestion Levels

HRTPO staff produces future PM Peak Period roadway congestion levels as part of the regional Long-Range Transportation Plan. These projections are based on predicted future year traffic volumes and the list of transportation projects that are expected to be completed by the horizon year. Congestion levels for the year 2040 were calculated using Highway Capacity Manual procedures described previously in this section. These 2040 PM Peak Period projected roadway volumes and congestion levels will be described further in Part III of this report.

The number of severely congested lane-miles in Hampton Roads is projected to grow significantly between 2018 and 2040, as shown in **Figure 8** on page

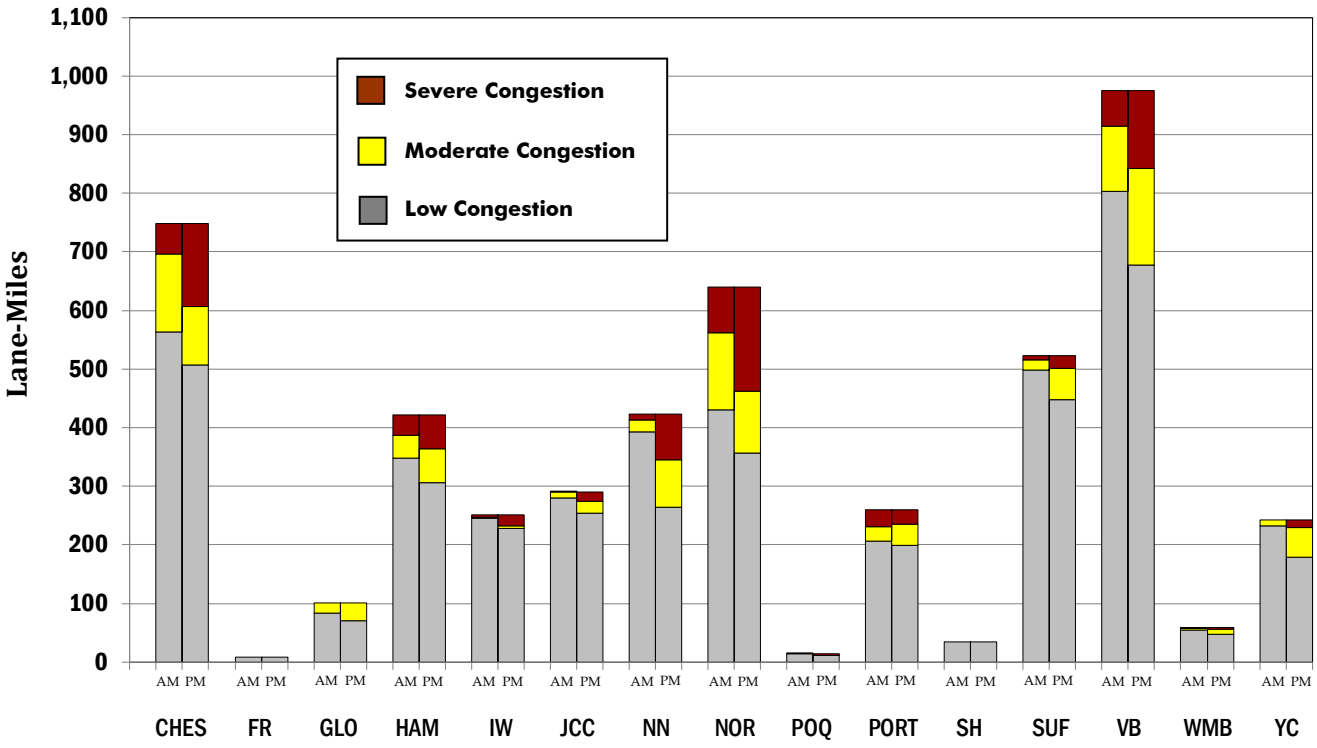

Figure 7 – Existing (2018) Locality Congestion Levels by Lane-Mile – AM and PM Peak Periods

Source: HRTPO analysis of INRIX and VDOT data.

Figure only include those roadways in the CMP Roadway Network within the Hampton Roads Metropolitan Planning Area (MPA).

16. In 2040, nearly one quarter (23%) of the Hampton Roads CMP Roadway Network is expected to operate at severely congested levels during the PM Peak Period, up from 14% in the 2018 Existing conditions. Only 53% of the CMP Roadway Network is projected to operate at low levels of congestion in the PM Peak Period in 2040, compared to 72% in Existing conditions.

It should be noted that caution needs to be used when making comparisons between this report's 2018 Existing congestion levels and the future 2040 congestion levels. Most of the 2018 Existing congestion analysis is based on a source of data (INRIX) that is different from the 2040 congestion analysis. Roadways with INRIX data are also analyzed by direction for both arterials and freeways, whereas the 2040 congestion analysis is not analyzed by direction for arterials. The directional INRIX analysis used for 2018 Existing conditions will inherently produce lower congestion levels than the non-directional analyses.

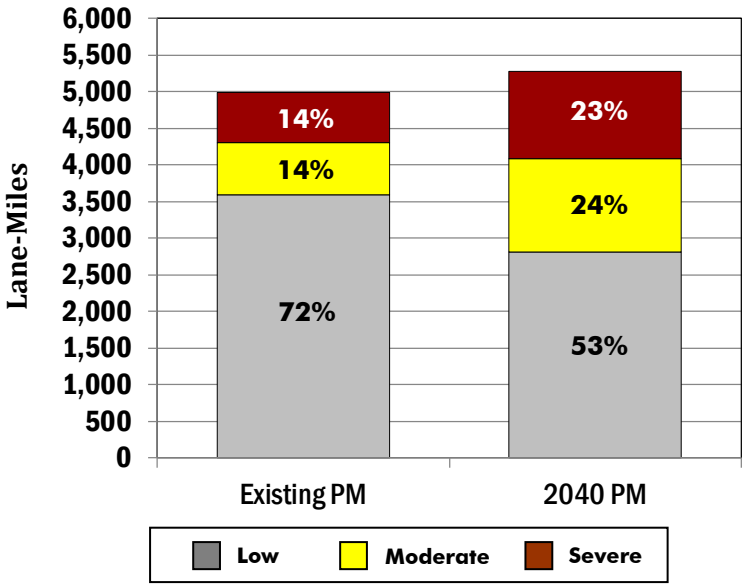

Figure 8 – Existing (2018) and 2040 Congestion Levels by Lane-Mile for the CMP Roadway Network (PM Peak Period)

Source: HRTPO analysis of HRTPO, INRIX, and VDOT data.

Figure only include those roadways in the CMP network within the Hampton Roads Metropolitan Planning Area (MPA).

Corridor Travel Times

HRTPO has analyzed the historical and existing travel times for ten of the most critical roadway corridors in the Hampton Roads transportation network using the INRIX data from the roadway congestion analysis. These ten corridors are:

- **Hampton Roads Bridge-Tunnel** – I-64 between I-664/Hampton Coliseum and I-564
- **Monitor-Merrimac Memorial Bridge-Tunnel** – I-664 between College Drive and Aberdeen Road
- **Midtown Tunnel** – Route 164/MLK Freeway between Cedar Road/London Boulevard and Brambleton Avenue and Hampton Boulevard/Brambleton Avenue between Colley Avenue/27th Street and Western Freeway.
- **Downtown Tunnel** – I-264 between Victory Boulevard and Ballentine Boulevard
- **I-64 High Rise Bridge** – I-64 between Bowers Hill (I-264/I-664 Interchange) and Greenbrier Parkway
- **I-64 Peninsula** – I-64 between Route 199 near Busch Gardens and Oyster Point Road
- **I-64/I-564 Norfolk** – I-64/I-564 between Admiral Taussig Boulevard and Indian River Road
- **I-264 Norfolk/Virginia Beach** – I-264 between Military Highway and Rosemont Road
- **I-664 Southside** – I-664 between Bowers Hill (I-64/I-264 Interchange) and College Drive
- **Chesapeake Expressway** – Route 168 between Battlefield Boulevard south of Great Bridge and I-64

Figures 9 – 18 on pages 18 – 22 show the travel times by direction in each of these ten corridors each year between 2013 and 2018. Notable changes in travel times include:

- Travel times largely increased at the **Hampton Roads Bridge-Tunnel**. Eastbound average travel times during the AM Peak Period increased from 15.3 minutes in 2013 to 19.7 minutes in 2018, and increased from 15.6 minutes to 23.1 minutes during the PM Peak Period. Westbound average AM Peak Period travel times increased from 9.8 minutes in 2013 to 14.0 minutes in 2018, and from 19.7 minutes to 28.4 minutes during the PM Peak Period.
- Travel times have improved at the **Midtown Tunnel** with the completion of the second tube. Eastbound AM Peak Period average travel times decreased from 13.1 minutes in 2016 down to 9.6 minutes in 2018. Westbound PM Peak Period average travel times decreased from 7.9 minutes in 2016 to 6.6 minutes in 2018.
- Travel times also improved at the **Downtown Tunnel**, largely due to the addition of tolls and the widening of the Midtown Tunnel. Eastbound AM Peak Period average travel times decreased from 14.9 minutes in 2013 down to 12.1 minutes in 2018. Westbound PM Peak Period average travel times decreased from 13.9 minutes in 2013 to 9.6 minutes in 2018.
- Travel times increased at the **High Rise Bridge**. Eastbound (towards Suffolk) average travel times during the AM Peak Period increased from 10.4 minutes in 2013 to 12.1 minutes in 2018, and increased from 14.1 minutes to 18.0 minutes during the PM Peak Period. Westbound (towards Virginia Beach) AM Peak Period average travel times increased from 16.8 minutes in 2013 to 18.7 minutes in 2018, and from 10.7 minutes to 14.3 minutes during the PM Peak Period.

Congestion Duration

In prior CMP documents, HRTPO staff calculated roadway congestion levels using traffic volumes and roadway characteristics without determining congestion duration as the data was unavailable. The duration of congestion on roadway segments can now be measured using INRIX travel time and speed data.

HRTPO staff determined the duration of congestion during each peak period for each roadway segment with INRIX data. Congestion levels were determined by direction for each of the 15-minute intervals during the AM Peak Period (5:00 am to 9:00 am) and the PM Peak Period (3:00 pm to 7:00 pm) using the severe congestion thresholds shown previously in Figure 2 on page 6. Each roadway segment may be congested for up to 16 15-minute intervals during each peak period.

Figure 19 on page 24 shows the six freeway and sixteen arterial segments that are severely congested for at least two hours (or 8 15-minute intervals) during the AM Peak Period. Freeway segments that are congested for at least two hours in the morning peak include I-564 approaching Naval Station Norfolk, the eastbound Hampton Roads Bridge-Tunnel approach, the westbound (towards Virginia Beach) High Rise Bridge approach, and the northbound Chesapeake Expressway at the interchange with I-64.

Figure 20 on pages 25-26 shows the 20 freeway and 42 arterial segments throughout Hampton Roads that are congested for at least three hours (or 12 15-minute intervals) during the PM Peak Period. Similar to the AM Peak Period, most of the freeway segments with the longest congestion duration during the PM Peak Period are at the region's bridges and tunnels. Six of the eight freeway segments that are congested for all four hours in the PM Peak Period are approaches to the Hampton Roads Bridge-Tunnel.

There are sixteen arterial segments that are congested for all four hours during the PM Peak Period. These arterial segments include portions of Battlefield Boulevard, Brambleton Avenue, Campostella Road,

HRBT Backup in Hampton VDOT

George Washington Highway in Deep Creek, Little Creek Road, Mercury Boulevard, the Fourth View Street approach to the Hampton Roads Bridge-Tunnel, and the St. Paul's Boulevard approach to the Downtown Tunnel.

Congestion duration information is available for each CMP Roadway Network segment in **Appendix B**, and **Appendices E-5 to E-8** contain maps showing the congestion duration for each roadway segment during the AM and PM Peak Periods.

Figure 20 (continued) – Roadway Segments that are Severely Congested for at Least Three Hours – 2018 PM Peak Period

Source: HRTPO analysis of INRIX data. # of severely congested 15-minute intervals represents the total number of intervals during the peak period where the travel time index exceeds the threshold for severe congestion. Each peak period includes a total of 16 15-minute intervals.

In the following tables, the following abbreviations are used for high profile locations:
DT = I-264/Downtown Tunnel GILM = US 13/Gilmerton Bridge HIGH RISE = I-64 corridor in Chesapeake HRBT = I-64/Hampton Roads Bridge-Tunnel
I-64/I-264 = I-64/I-264 interchange area in Norfolk MMMBT = I-664/Monitor-Merrimac Mem. Bridge-Tunnel MT = US 58/Midtown Tunnel

Total Delay

Although the travel time index describes the level of congestion that each roadway user experiences, it does not measure the total congestion present on the roadway segment. Total delay on each roadway segment takes into account both the congestion level and the volume of users (or vehicles) that each roadway carries.

HRTPO staff calculated the total amount of delay that occurs on each roadway segment by direction during each peak period. This required combining the average and free flow travel speeds based on the INRIX data with the traffic volume data during the same period. Total delay (in hours) was calculated by direction per 15-minute interval for each roadway segment where INRIX data was available using the following equation:

$$\text{Total Delay} = \left(\text{Average Travel Time} - \text{Free flow Travel Time}\right) \times \text{Volume}$$

These 15-minute delay values were summed to produce a total delay value in vehicle-hours for both the entire AM Peak Period and PM Peak Period. Roadway segments in the CMP Roadway Network vary greatly in length, so this total delay was divided by the total length of the segment to produce a total delay per mile value for each peak period.

Figure 21 on page 28 shows the top 25 freeway segments and top 25 arterial segments in terms of highest total delay per mile during the AM Peak Period. Freeway segments with the highest delay per mile not only include approaches to the Hampton Roads Bridge-Tunnel, Downtown Tunnel, and High Rise Bridge but also include the northbound Chesapeake Expressway approaching the I-64/I-464 interchange and I-564 approaching Naval Station Norfolk. Top arterial segments include sections of St. Pauls Boulevard, Tidewater Drive, Battlefield Boulevard, Independence Boulevard, and Woodland Road approaching the Hampton Roads Bridge-Tunnel.

Figure 22 on page 29 shows the top 25 freeway segments and top 25 arterial segments in terms of highest total delay per mile during the PM Peak Period. Most of the freeway segments with the highest delay per mile during the PM Peak Period are approaches to the Hampton Roads Bridge-Tunnel, High Rise Bridge, I-64/I-264 Interchange, Monitor-Merrimac Memorial Bridge-Tunnel, and Downtown Tunnel. In terms of arterials, southbound St. Pauls Boulevard approaching the entrance ramp to I-264/Downtown Tunnel has the most delay per mile, followed by sections of Battlefield Boulevard, Indian River Road, and Mercury Boulevard.

Western Freeway approaching the Midtown Tunnel HRTPO

Total delay information is available for every CMP Roadway Network segment in **Appendix C**, and **Appendices E-9 to E-12** contain maps showing total delay per mile for each roadway segment during the AM and PM Peak Periods.

Figure 22 – Roadway Segments with the Highest Total Delay per Mile – 2018 PM Peak Period

Source: HRTPO analysis of INRIX data. Total hours of delay per mile is comprised of the sum of the delay that each vehicle experiences during the peak period divided by the total length of the segment.

In the following tables, the following abbreviations are used for high profile locations:
DT = I-264/Downtown Tunnel GILM = US 13/Gilmerton Bridge HIGH RISE = I-64 corridor in Chesapeake HRBT = I-64/Hampton Roads Bridge-Tunnel
I-64/I-264 = I-64/I-264 interchange area in Norfolk MMMBT = I-664/Monitor-Merrimac Mem. Bridge-Tunnel MT = US 58/Midtown Tunnel

Travel Time Reliability

Although roadway congestion is prevalent in many areas of Hampton Roads, congestion levels are not always the same each day. Congestion levels can vary greatly from day to day due to a variety of factors such as crashes, bad weather, special events, or work zones (**Figure 23**).

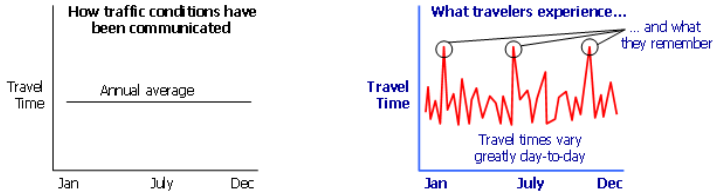

Figure 23 – Average versus Daily Travel Times
Source: FHWA.

Travel time "reliability" is defined as how steady travel times are over the course of time, as measured generally from day to day. The reliability of travel times is very important for many people, such as those that must arrive on time to work or an appointment, catch a flight at the airport, or pick up children from day care. The consistency and dependability of travel times is critical for many of these roadway users, so analyzing not only average congestion levels but also the travel time reliability of the regional roadway network is important.

There are a number of measures that are used to describe the travel time reliability of roadway segments. Among these measures are the "buffer index" and the "planning time index", which are both shown in **Figure 24**. The buffer index uses the buffer time – which is the extra time that travelers must add to their average travel time when planning trips to ensure that they will arrive on-time 95 percent of the time – to measure travel time reliability compared to typical conditions. The buffer index has a minimum value of zero and increases as the roadway network becomes less reliable.

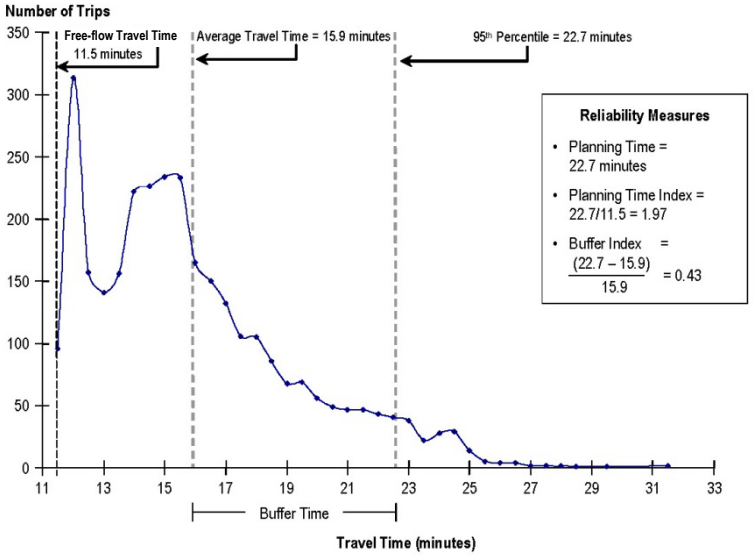

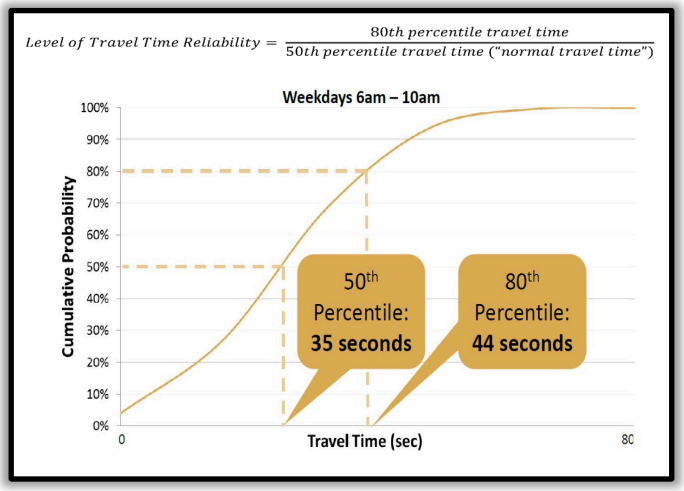

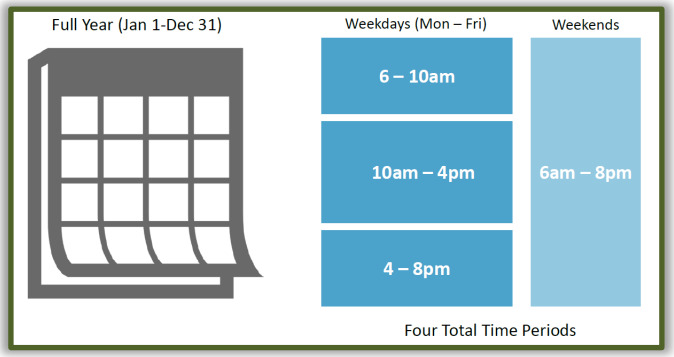

Figure 24 – Relationship between Various Delay and Reliability Measures
Source: FHWA.

The planning time index measures reliability by comparing travel times during some of the most congested conditions with travel times in free-flow, uncongested conditions. The planning time index is generally greater than or equal to one and increases as the roadway network becomes more congested and less reliable.

The reliability of the system can also be calculated using a new metric referred to as the Level of Travel Time Reliability (LOTTR). The LOTTR is defined as the ratio of the 80th percentile travel time to the mean (50th percentile) travel time. An example of this calculation is shown below, using travel time information that is collected throughout the year on each segment in 15-minute intervals:

Travel times throughout the year are divided into four reporting periods: weekday morning peak, weekday midday, weekday afternoon peak, and weekends. The time of day that each period represents is shown below:

A LOTTR ratio is calculated for each roadway segment by direction for each of these time periods over the course of an entire year. This produces a total of four LOTTR ratios for each directional segment. Segments are considered to be not reliable if any of these four LOTTR ratios are 1.50 or greater. For a segment to be classified as reliable, all four LOTTR ratios must be below 1.50. An example of this calculation is shown below:

$$\frac{\text{Longer Travel Time (80th)}}{\text{Normal Travel Time (50th)}} = \frac{\text{\# seconds}}{\text{\# seconds}} = \text{Level of Travel Time Reliability Ratio}$$

Level of Travel Time Reliability (LOTTR) *(Single Segment, Interstate Highway System)*		
Monday – Friday	6am – 10am	LOTTR = $\frac{44 \text{ sec}}{35 \text{ sec}}$ = 1.26
	10am – 4pm	LOTTR = 1.39
	4pm – 8pm	LOTTR = 1.54
Weekends	6am – 8pm	LOTTR = 1.31
Must exhibit LOTTR below 1.50 during **all** of the time periods		Segment is not reliable

As described in Part I of this report, the HRTPO established four-year performance targets (2018-2021) of greater than 82% of the Interstate travel in the region being reliable, and greater than 82.5% of the Non-Interstate National Highway System (NHS) travel being reliable. Both of these percentages match the statewide targets established by the Commonwealth Transportation Board (CTB).

Figure 25 on page 32 shows the top 25 freeway segments and top 25 arterial segments in terms of the Level of Travel Time Reliability (LOTTR). Five of the top six freeway segments with the highest LOTTR are approaches to the Hampton Roads Bridge-Tunnel. Approaches to the Monitor-Merrimac Memorial Bridge Tunnel, Downtown Tunnel, and High Rise Bridge are also on the list of freeway segments with the highest LOTTR.

In terms of arterials, five of the top six segments with the highest LOTTR are approaches to the Hampton Roads Bridge-Tunnel. Other arterial segments with the highest LOTTR include approaches to the Downtown Tunnel and short segments of Chesapeake Boulevard, Freeman Avenue, Pacific Avenue, Commander Shepard Boulevard, and Tidewater Drive.

Appendices E-13 and E-14 contain maps showing the Level of Travel Time Reliability for each roadway segment, and **Appendices E-15 and E-16** contain maps showing the number of unreliable periods for each segment. LOTTR information for each roadway segment is also shown in **Appendix C**.

Figure 25 – Roadway Segments with the Highest Level of Travel Time Reliability (LOTTR) – 2018

Source: HRTPO analysis of INRIX data.

In the following tables, the following abbreviations are used for high profile locations:
DT = I-264/Downtown Tunnel GILM = US 13/Gilmerton Bridge HIGH RISE = I-64 corridor in Chesapeake HRBT = I-64/Hampton Roads Bridge-Tunnel
I-64/I-264 = I-64/I-264 interchange area in Norfolk MMMBT = I-664/Monitor-Merrimac Mem. Bridge-Tunnel MT = US 58/Midtown Tunnel

Freight Movement

Freight movement is a critical component of the Hampton Roads economy, and trucks are the primary mode for moving freight to and from the Port of Virginia. Trucks also supply the goods used by each resident and business in the region.

Ensuring the efficient movement of freight is necessary since so many companies rely on just-in-time delivery of goods for their supply chains. Delays and uncertainty in the movement of freight contribute to higher manufacturing costs and additional inventory levels which not only impact the economic competitiveness of these businesses but can also lead to higher costs of goods for consumers.

Three measures are used in this CMP to measure the impact of congestion on freight movement. These measures include:

- Weekday Number of Trucks
- Truck Delay
- Truck Travel Time Reliability

Each of these measures is described below.

Weekday Number of Trucks

A simple measure of the impact of trucks on a particular roadway is the number of trucks that use the roadway each day. As part of its Traffic Monitoring Program, VDOT collects vehicle classification data at about one-third of the count locations statewide. For the remaining locations, VDOT provides an estimate of the percentage of vehicles that are trucks, and the percentage can be applied to the roadway's weekday traffic volume to estimate the number of trucks.

Appendix C includes information on the number of trucks that use each roadway segment each weekday.

Truck Delay

One of the metrics used to measure congestion levels in this report is total delay. As stated previously, measuring the total delay on each roadway segment takes into account both the congestion level and the volume of users (or vehicles) that each roadway

carries. The method to calculate truck delay is the same as the method to calculate total delay, except that the number of trucks is used in place of the total number of vehicles to account only for that delay experienced by freight movement.

Figure 26 on page 34 shows the top 25 freeway segments and top 25 arterial segments in terms of highest total truck delay per mile during the AM Peak Period. Freeway segments with the highest truck delay per mile are largely comprised of approaches to the High Rise Bridge, Hampton Roads Bridge-Tunnel, and Downtown Tunnel. Top arterial segments include a section of Route 460 in Windsor, a section of Tidewater Drive in Norfolk, and a section of Greenbrier Parkway in Chesapeake.

Figure 27 on page 35 shows the top 25 freeway segments and top 25 arterial segments in terms of highest total truck delay per mile during the PM Peak Period. The top ten freeway segments with the highest truck delay per mile are approaches to the Monitor-Merrimac Memorial Bridge-Tunnel, Hampton Roads Bridge-Tunnel, High Rise Bridge, and Downtown Tunnel. In terms of arterials, sections of Indian River Road and Tidewater Drive comprised the top four segments with the highest truck delay per mile.

Total truck delay information is available for every CMP roadway segment in **Appendix C**, and **Appendices E-17 to E-20** contain maps showing total truck delay per mile for each roadway segment during the AM and PM Peak Periods.

Truck Travel Time Reliability

While the travel time reliability of the roadway network can be measured using the Level of Travel Time Reliability (LOTTR) as described previously, the reliability of freight movement can be calculated using a new metric referred to as the Truck Travel Time Reliability (TTTR) Index.

The TTTR ratio is defined as the ratio of the 95th percentile travel time for trucks to the mean (50th percentile) travel time for trucks, based on the travel time information that is collected in 15-minute intervals throughout the year on each segment. An example of calculating this ratio is shown below:

Truck travel times throughout the year are divided into five reporting periods: weekday morning peak, weekday midday, weekday afternoon peak, weekends, and overnight. The time of day that each period represents is shown below:

A TTTR ratio is calculated for each roadway segment by direction for each of these time periods over the course of an entire year. This produces a total of five TTTR ratios for each segment. The maximum of these five TTTR ratios is used to determine the segment's overall TTTR. This calculation is highlighted below:

$$\frac{\text{Longer Truck Travel Time (95th)}}{\text{Normal Truck Travel Time (50th)}} = \frac{\text{\# seconds}}{\text{\# seconds}} = \text{Truck Travel Time Reliability (TTTR) Ratio}$$

Truck Travel Time Reliability (TTTR)
(Single Segment, Interstate Highway System)

Monday – Friday	6am – 10am	TTTR = 72 sec / 50 sec = 1.44
	10am – 4pm	TTTR = 1.39
	4pm – 8pm	TTTR = **1.49**
Weekends	6am – 8pm	TTTR = 1.31
Overnight	8pm – 6am	TTTR = 1.20
Maximum TTTR		**1.49**

As described in Part I of this report, the HRTPO established four-year performance targets (2018-2021) for the Truck Travel Time Reliability Index on the regional Interstate system of less than 2.13. This target was chosen by applying VDOT's expected annual statewide increase in the TTTR Index to the regional TTTR Index in Hampton Roads in 2017.

Figure 28 on page 37 shows the top 25 freeway segments and top 25 arterial segments in terms of highest TTTR Index. Similar to the other measures, the freeway segments with the highest TTTR values include approaches to the Hampton Roads Bridge-Tunnel, Monitor-Merrimac Memorial Bridge-Tunnel, High Rise Bridge, and Downtown Tunnel. Many of the top arterial segments are approaches to the Hampton Roads Bridge-Tunnel, including Woodland Road, Fourth View Street, Settlers Landing Road, Tidewater Drive, and Mallory Street. Other arterial segments with the highest TTTR Indices include short sections of Yorktown Road, Chesapeake Boulevard, Battlefield Boulevard, Independence Boulevard, and Dock Landing Road.

Appendices E-21 and E-22 contain maps showing the TTTR Index for each roadway segment, and this information is available for every CMP roadway segment in **Appendix C**.

Figure 28 – Roadway Segments with the Highest Truck Travel Time Reliability (TTTR) – 2018

Source: HRTPO analysis of INRIX data.

In the following tables, the following abbreviations are used for high profile locations:
DT = I-264/Downtown Tunnel GILM = US 13/Gilmerton Bridge HIGH RISE = I-64 corridor in Chesapeake HRBT = I-64/Hampton Roads Bridge-Tunnel
I-64/I-264 = I-64/I-264 interchange area in Norfolk MMMBT = I-664/Monitor-Merrimac Mem. Bridge-Tunnel MT = US 58/Midtown Tunnel

RANKING OF CMP CONGESTED CORRIDORS

It is imperative that scarce transportation funding be allocated to projects that provide the greatest benefit to the region. For this reason, the HRTPO uses a comprehensive Project Prioritization Process to assist in selecting projects for inclusion in the regional Long-Range Transportation Plan, as well as for specific funding sources such as the Regional Surface Transportation Program (RSTP).

HRTPO staff produced a ranking of roadway segments throughout the region as part of this CMP analysis. This section details the methodology used to determine which congested corridors throughout Hampton Roads should be analyzed in further detail in Part III - Congestion Mitigation of this report.

CMP SEGMENT SCORING CRITERIA

A variety of factors were considered for comparing congested locations. Based on an assessment of available data, as well as discussions with other transportation planners and engineers throughout the region, five factors were included in the "CMP Segment Scoring Criteria" as shown in the box to the right.

The congestion, travel time reliability and freight criteria have been described previously in this report. In addition, safety and roadway type are used as criteria to rank CMP segments. Roadway safety is analyzed using Potential for Safety Improvement (PSI) data provided by VDOT. PSI measures the difference between the number of crashes that occur on a particular roadway segment or at a particular intersection compared to the number of crashes that would be predicted to occur at that location.

Roadway type is also included in the criteria for scoring congested locations. Priority is given to roadways that are part of the National Highway System, which is a federally-defined network of roadways important to the nation's economy, defense, and mobility, and the Strategic Highway Network (STRAHNET), which is a national roadway network deemed necessary for emergency mobilization and peacetime movement of equipment and commodities to support U.S. military operations. In addition, Roadways Serving the Military as defined in HRTPO's *Hampton Roads Military Transportation Study* are also prioritized, due to the importance of the military to the region.

Once these five criteria were selected, weights were applied to each criterion to produce scores for each congested roadway segment. These weights are shown in **Figure 29** on page 40. In order to be scored, however, CMP segments must have an existing AM or PM Peak Period congestion level that is classified as severely congested.

Each severely congested CMP Roadway Network segment was scored by direction for both the morning and afternoon peak periods, with a maximum score of 100 points available for each directional segment in each peak period. The highest of the AM Peak Period and PM Peak Period point totals was used as the overall CMP Segment Score.

The CMP Segment Scores for each roadway segment are shown in **Maps 5 and 6** on pages 41-42, and are also included in **Appendix D**.

CMP SEGMENT SCORING CRITERIA

CONGESTION

1) Congestion Level
2) Total Vehicle Delay
3) Congestion Duration

TRAVEL TIME RELIABILITY

1) Level of Travel Time Reliability (LOTTR)
2) LOTTR Duration

FREIGHT

1) Existing Weekday Truck Volume
2) Total Truck Delay
3) Truck Travel Time Reliability (TTTR)

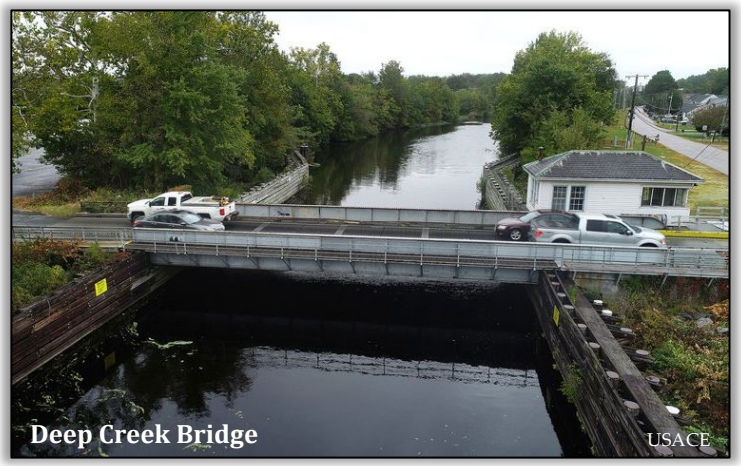

SAFETY

1) Segment Potential for Safety Improvement
2) Intersection Potential for Safety Improvement

ROADWAY TYPE

1) National Highway System/STRAHNET/ Roadway Serving the Military

Once CMP Segment Scores were calculated for each congested roadway segment in the region, adjacent high scoring segments were grouped into corridors for analysis purposes. "CMP Congested Corridors" were created based on the location and proximity of each congested roadway segment and were ranked based on the roadway segments with the highest CMP Segment Scores. The top ranked CMP Congested Corridors are shown in **Figure 30** on page 43 and **Maps 7-8** on pages 44-45.

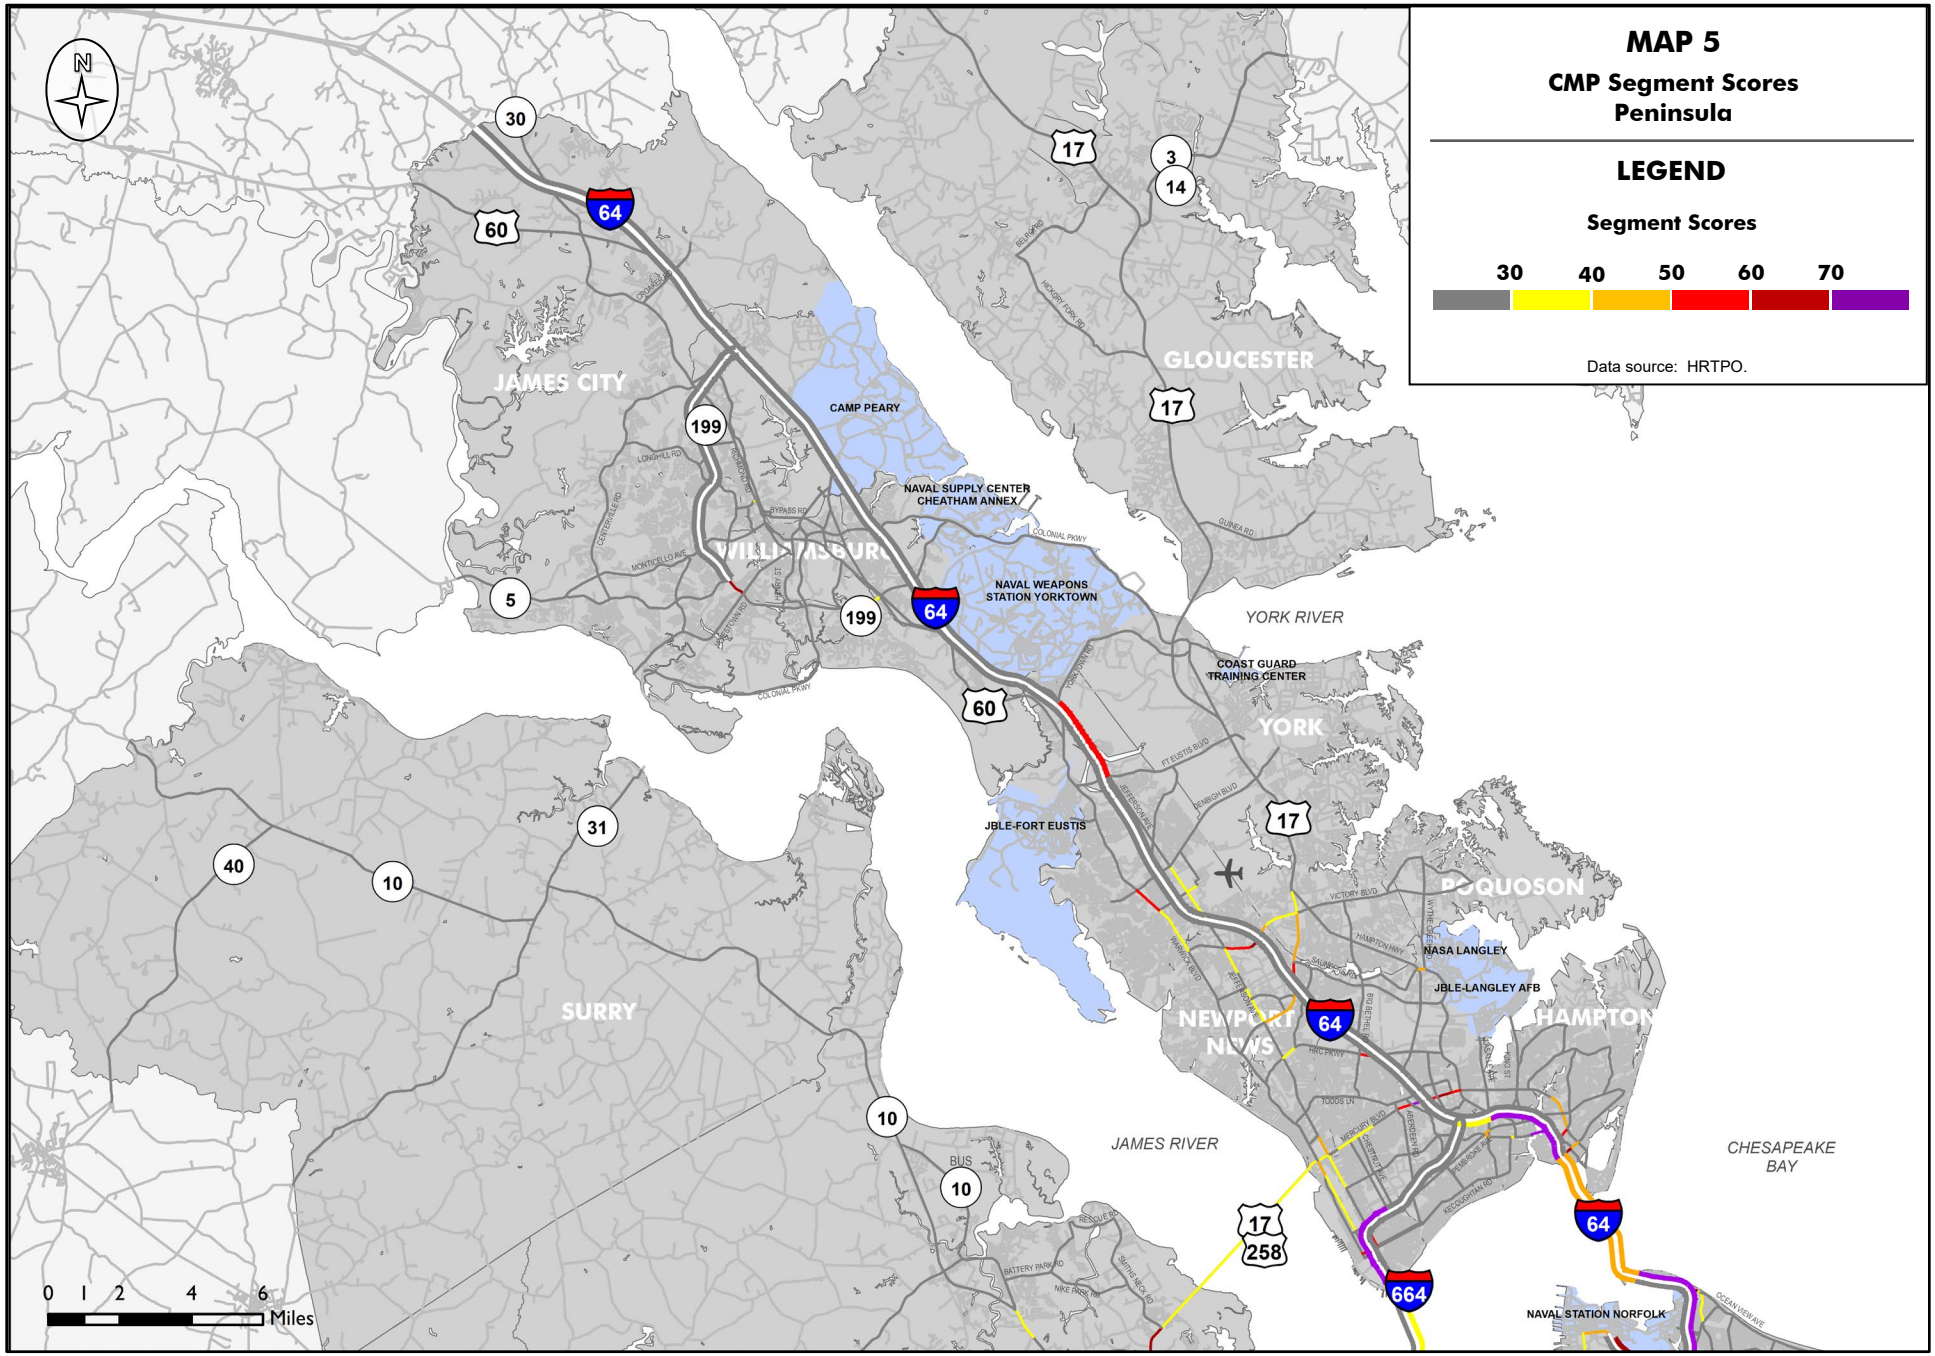

Deep Creek Bridge USACE

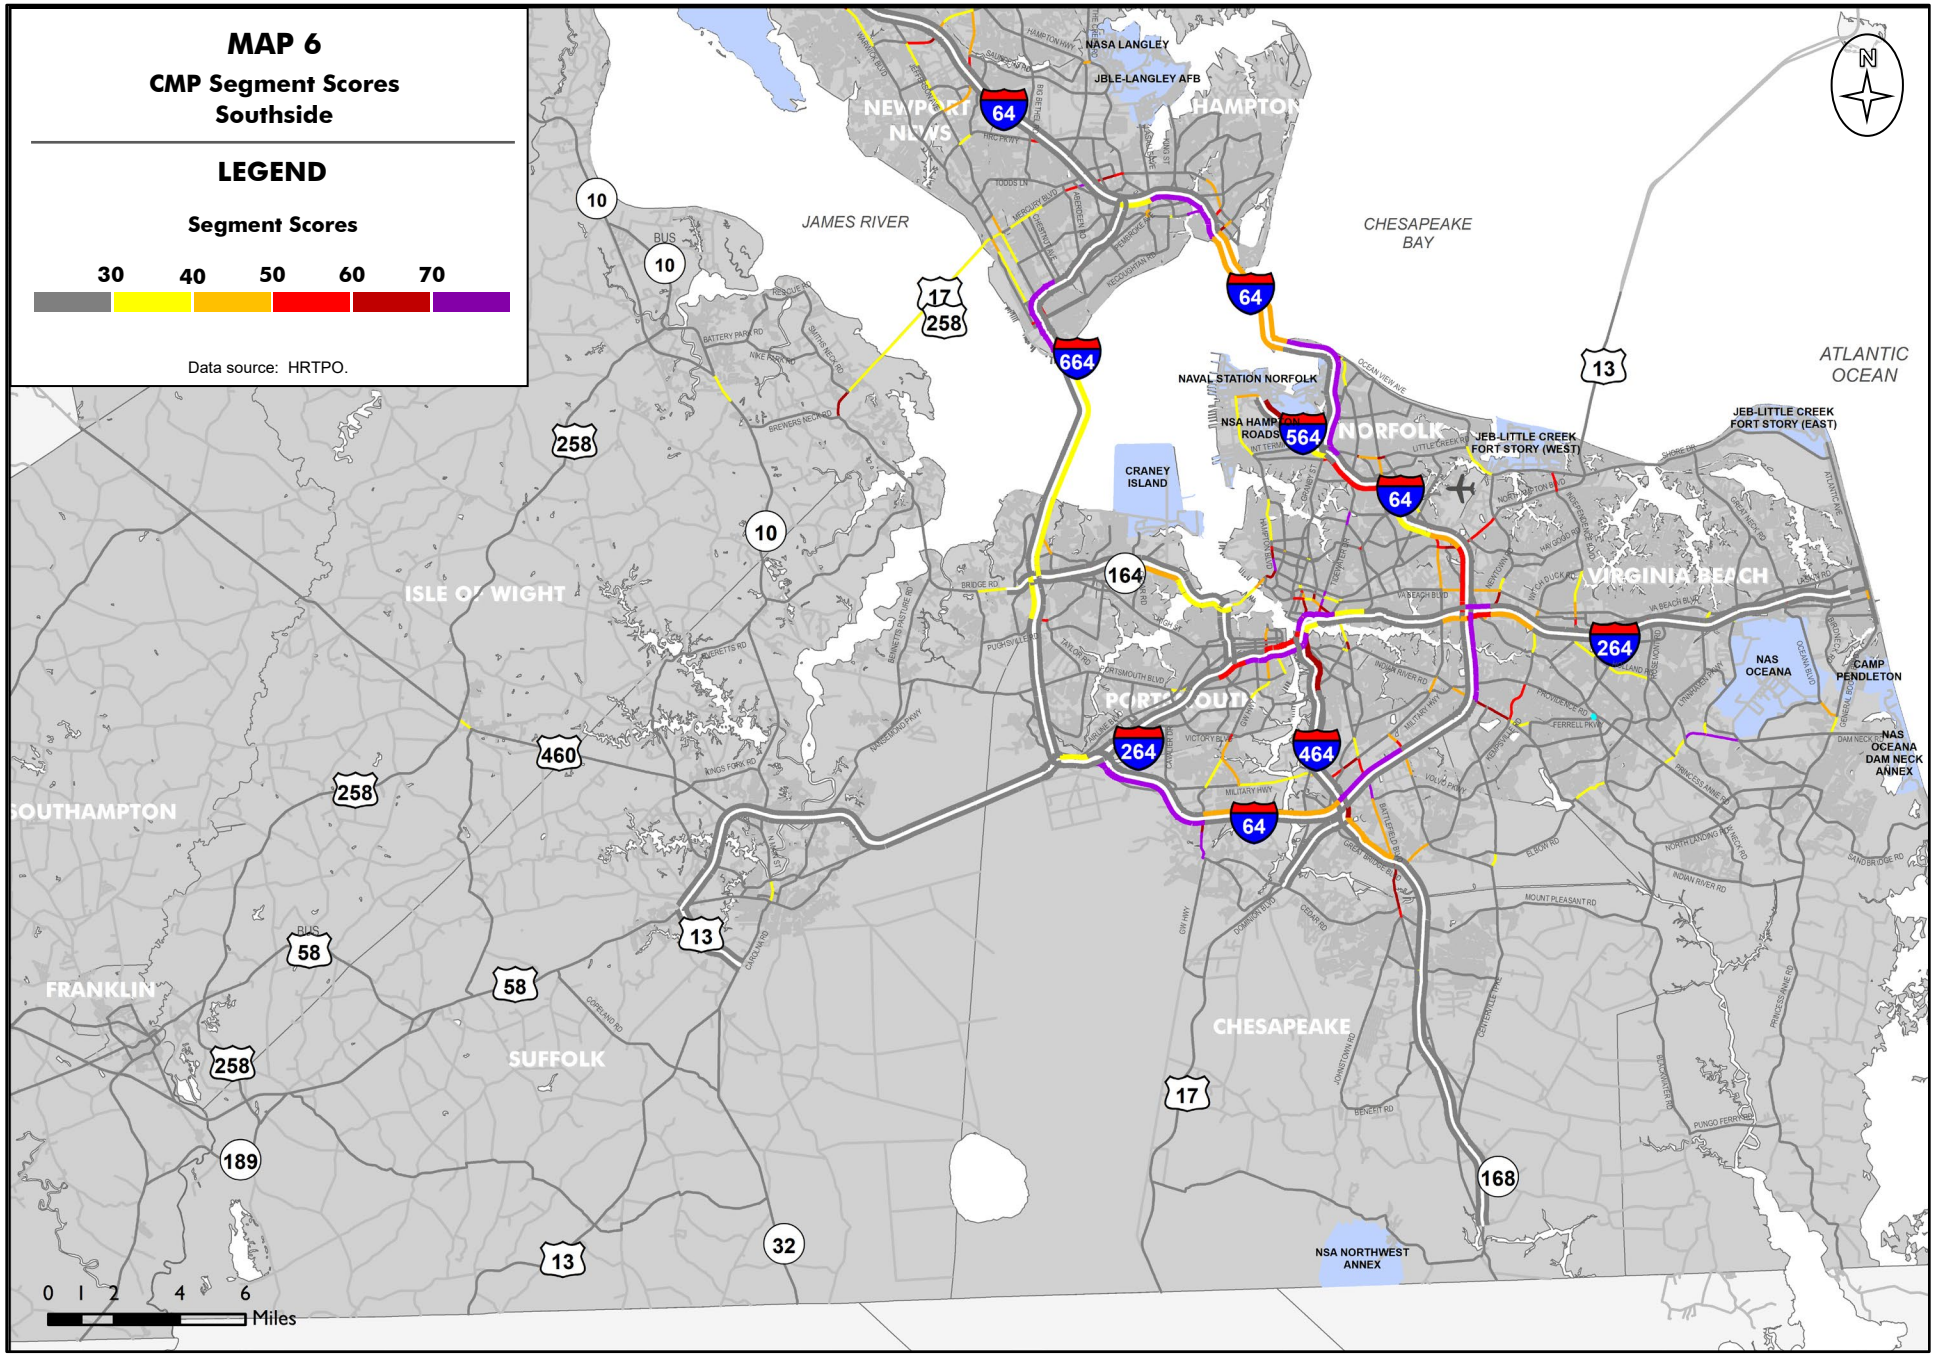

Most of the highest-rated CMP Congested Corridors are examined in detail in Part III of this report to determine possible countermeasures to alleviate congestion. However, some corridors may be excluded due to upcoming, ongoing or recently completed projects that impact congestion on the corridor. For example, construction was recently completed on a major intersection improvement on Indian River Road at Kempsville Road that has impacted congestion on Arterial Corridor 12 – Indian River Road, and upcoming construction to widen the Deep Creek Bridge will likely resolve the congestion issues with Arterial Corridor 4 – George Washington Highway. In addition, many of the congested freeway segments in the region are either under construction or, in the case of the Hampton Roads Bridge-Tunnel, will soon be under construction.

CMP PERFORMANCE MEASURES		WITH INRIX SPEED DATA: FREEWAYS VALUE	FREEWAYS SCORE	WITH INRIX SPEED DATA: ARTERIALS VALUE	ARTERIALS SCORE	WITHOUT INRIX SPEED DATA: ARTERIALS VALUE	ARTERIALS SCORE

Figure 29 – CMP Segment Scoring Criteria

1 – Roadway segments were scored using the higher peak period (AM or PM) for all congestion and reliability performance measures.
2 – CMP roadway segments must have an existing AM or PM peak period congestion level that is classified as severely congested to be scored.
3 – Based on VDOT vehicle classification data. For those locations where truck data is not collected by VDOT, VDOT estimates were used.
4 – For Intersection Potential for Safety Improvement (PSI), the highest ranked intersection throughout the roadway segment was used.
5 – Methodology and scoring developed within HRTPO's Hampton Roads Military Transportation Needs Study - 2018 Update.

SUMMARY

This Congestion Management Process report is being prepared in three parts. While Part I of the study included the Introduction and focused on information related to System Monitoring, Part II details the performance of the regional roadway system. This System Performance report includes an analysis of existing peak period congestion levels, congestion duration, total delay, travel time reliability, and freight movement on over 1,600 miles of roadway throughout the region. This analysis was primarily completed using INRIX travel time and speed data.

Using this analysis, CMP Roadway Network segments were scored by direction for each peak period, and adjacent high scoring segments were grouped into "CMP Congested Corridors". These corridors were then ranked on a regional basis.

The information from this Part II report will be incorporated into Part III of this Congestion Management Process update. Part III will detail Congestion Mitigation, including future and ongoing roadway projects and the tools and methods that can be implemented to improve congested roadways. In addition, most of the highest-ranked CMP Congested Corridors that were identified in this Part II report will be analyzed in detail to identify causes of congestion and determine possible countermeasures to alleviate congestion.

PUBLIC REVIEW AND COMMENT

As part of the Hampton Roads Transportation Planning Organization's (HRTPO) efforts to provide opportunities for the public and stakeholders to review and comment on this draft report prior to the final product being published, a public review period was conducted from August 26, 2020, through September 28, 2020. No public comments were received.

Appendix A – Weekday Traffic Volumes

Count Date listed as "1/1-12/31" indicates that the count reflects an average of all Tuesdays, Wednesdays, and Thursdays, minus holidays.
Count Source: C=City, E=Estimate, O=Other, T=Tunnel or toll facility, V=VDOT.

JURIS NAME	FACILITY NAME	SEGMENT FROM	SEGMENT TO	DIR	WEEKDAY TRAFFIC VOLUMES																		MOST RECENT VOLUME

Appendix A – Weekday Traffic Volumes

Count Date listed as "1/1-12/31" indicates that the count reflects an average of all Tuesdays, Wednesdays, and Thursdays, minus holidays.
Count Source: C=City, E=Estimate, O=Other, T=Tunnel or toll facility, V=VDOT.

JURIS NAME	FACILITY NAME	SEGMENT FROM	SEGMENT TO	DIR	WEEKDAY TRAFFIC VOLUMES																		MOST RECENT VOLUME

Appendix A – Weekday Traffic Volumes

Count Date listed as "1/1-12/31" indicates that the count reflects an average of all Tuesdays, Wednesdays, and Thursdays, minus holidays.
Count Source: C=City, E=Estimate, O=Other, T=Tunnel or toll facility, V=VDOT.

Appendix A – Weekday Traffic Volumes

Count Date listed as "1/1-12/31" indicates that the count reflects an average of all Tuesdays, Wednesdays, and Thursdays, minus holidays.
Count Source: C=City, E=Estimate, O=Other, T=Tunnel or toll facility, V=VDOT.

Appendix A – Weekday Traffic Volumes

Count Date listed as "1/1-12/31" indicates that the count reflects an average of all Tuesdays, Wednesdays, and Thursdays, minus holidays.
Count Source: C=City, E=Estimate, O=Other, T=Tunnel or toll facility, V=VDOT.

Appendix A – Weekday Traffic Volumes

Count Date listed as "1/1-12/31" indicates that the count reflects an average of all Tuesdays, Wednesdays, and Thursdays, minus holidays.
Count Source: C=City, E=Estimate, O=Other, T=Tunnel or toll facility, V=VDOT.

JURIS NAME	FACILITY NAME	SEGMENT FROM	SEGMENT TO	DIR	WEEKDAY TRAFFIC VOLUMES																		MOST RECENT VOLUME

Speed represents the slowest 15-minute average speed that occurs during each weekday peak period. (AM: 5-9 am and PM: 3-7 pm).
TTI represents the ratio of the travel time in the slowest 15-minute period during each peak period to the travel time in free-flow conditions.
Congestion Duration represents the total number of 15-minute periods during each peak period (out of 16) that experience severe congestion.

Appendix B – Speed and Congestion Data

Speed represents the slowest 15-minute average speed that occurs during each weekday peak period. (AM: 5-9 am and PM: 3-7 pm).
TTI represents the ratio of the travel time in the slowest 15-minute period during each peak period to the travel time in free-flow conditions.
Congestion Duration represents the total number of 15-minute periods during each peak period (out of 16) that experience severe congestion.

Appendix B – Speed and Congestion Data

Speed represents the slowest 15-minute average speed that occurs during each weekday peak period. (AM: 5-9 am and PM: 3-7 pm).
TTI represents the ratio of the travel time in the slowest 15-minute period during each peak period to the travel time in free-flow conditions.
Congestion Duration represents the total number of 15-minute periods during each peak period (out of 16) that experience severe congestion.

Appendix B – Speed and Congestion Data

Speed represents the slowest 15-minute average speed that occurs during each weekday peak period. (AM: 5-9 am and PM: 3-7 pm).
TTI represents the ratio of the travel time in the slowest 15-minute period during each peak period to the travel time in free-flow conditions.
Congestion Duration represents the total number of 15-minute periods during each peak period (out of 16) that experience severe congestion.

Appendix B – Speed and Congestion Data

Speed represents the slowest 15-minute average speed that occurs during each weekday peak period. (AM: 5-9 am and PM: 3-7 pm).
TTI represents the ratio of the travel time in the slowest 15-minute period during each peak period to the travel time in free-flow conditions.
Congestion Duration represents the total number of 15-minute periods during each peak period (out of 16) that experience severe congestion.

Appendix B – Speed and Congestion Data

Speed represents the slowest 15-minute average speed that occurs during each weekday peak period. (AM: 5-9 am and PM: 3-7 pm).
TTI represents the ratio of the travel time in the slowest 15-minute period during each peak period to the travel time in free-flow conditions.
Congestion Duration represents the total number of 15-minute periods during each peak period (out of 16) that experience severe congestion.

Appendix B – Speed and Congestion Data

Speed represents the slowest 15-minute average speed that occurs during each weekday peak period. (AM: 5-9 am and PM: 3-7 pm).
TTI represents the ratio of the travel time in the slowest 15-minute period during each peak period to the travel time in free-flow conditions.
Congestion Duration represents the total number of 15-minute periods during each peak period (out of 16) that experience severe congestion.

Appendix B – Speed and Congestion Data

Speed represents the slowest 15-minute average speed that occurs during each weekday peak period. (AM: 5-9 am and PM: 3-7 pm).
TTI represents the ratio of the travel time in the slowest 15-minute period during each peak period to the travel time in free-flow conditions.
Congestion Duration represents the total number of 15-minute periods during each peak period (out of 16) that experience severe congestion.

Appendix B – Speed and Congestion Data

Speed represents the slowest 15-minute average speed that occurs during each weekday peak period. (AM: 5-9 am and PM: 3-7 pm).
TTI represents the ratio of the travel time in the slowest 15-minute period during each peak period to the travel time in free-flow conditions.
Congestion Duration represents the total number of 15-minute periods during each peak period (out of 16) that experience severe congestion.

Speed represents the slowest 15-minute average speed that occurs during each weekday peak period. (AM: 5-9 am and PM: 3-7 pm).
TTI represents the ratio of the travel time in the slowest 15-minute period during each peak period to the travel time in free-flow conditions.
Congestion Duration represents the total number of 15-minute periods during each peak period (out of 16) that experience severe congestion.

Appendix B – Speed and Congestion Data

Speed represents the slowest 15-minute average speed that occurs during each weekday peak period. (AM: 5-9 am and PM: 3-7 pm).
TTI represents the ratio of the travel time in the slowest 15-minute period during each peak period to the travel time in free-flow conditions.
Congestion Duration represents the total number of 15-minute periods during each peak period (out of 16) that experience severe congestion.

Appendix B – Speed and Congestion Data

Speed represents the slowest 15-minute average speed that occurs during each weekday peak period. (AM: 5-9 am and PM: 3-7 pm).
TTI represents the ratio of the travel time in the slowest 15-minute period during each peak period to the travel time in free-flow conditions.
Congestion Duration represents the total number of 15-minute periods during each peak period (out of 16) that experience severe congestion.

Appendix B – Speed and Congestion Data

Speed represents the slowest 15-minute average speed that occurs during each weekday peak period. (AM: 5-9 am and PM: 3-7 pm).
TTI represents the ratio of the travel time in the slowest 15-minute period during each peak period to the travel time in free-flow conditions.
Congestion Duration represents the total number of 15-minute periods during each peak period (out of 16) that experience severe congestion.

Total Delay = [(Average Travel Time – Free Flow Travel Time) x Volume], summed for each 15-minute interval during the peak period.
LOTTR = Level of Travel Time Reliability. Segments with an LOTTR ≥ 1.50 are considered not reliable.
TTTR = Truck Travel Time Reliability.

JURIS NAME	FACILITY NAME	SEGMENT FROM	SEGMENT TO	DIR	2018 DELAY DATA				2018 RELIABILITY DATA				2018 TRUCK DATA

Appendix C – Delay, Reliability and Truck Data

Total Delay = [(Average Travel Time – Free Flow Travel Time) x Volume], summed for each 15-minute interval during the peak period.
LOTTR = Level of Travel Time Reliability. Segments with an LOTTR ≥ 1.50 are considered not reliable.
TTTR = Truck Travel Time Reliability.

Total Delay = [(Average Travel Time – Free Flow Travel Time) x Volume], summed for each 15-minute interval during the peak period.
LOTTR = Level of Travel Time Reliability. Segments with an LOTTR ≥ 1.50 are considered not reliable.
TTTR = Truck Travel Time Reliability.

Appendix C – Delay, Reliability and Truck Data

Total Delay = [(Average Travel Time – Free Flow Travel Time) x Volume], summed for each 15-minute interval during the peak period.
LOTTR = Level of Travel Time Reliability. Segments with an LOTTR ≥ 1.50 are considered not reliable.
TTTR = Truck Travel Time Reliability.

Appendix C – Delay, Reliability and Truck Data

Total Delay = [(Average Travel Time – Free Flow Travel Time) x Volume], summed for each 15-minute interval during the peak period.
LOTTR = Level of Travel Time Reliability. Segments with an LOTTR ≥ 1.50 are considered not reliable.
TTTR = Truck Travel Time Reliability.

Appendix C – Delay, Reliability and Truck Data

Total Delay = [(Average Travel Time – Free Flow Travel Time) x Volume], summed for each 15-minute interval during the peak period.
LOTTR = Level of Travel Time Reliability. Segments with an LOTTR ≥ 1.50 are considered not reliable.
TTTR = Truck Travel Time Reliability.

Appendix C – Delay, Reliability and Truck Data

Total Delay = [(Average Travel Time – Free Flow Travel Time) x Volume], summed for each 15-minute interval during the peak period.
LOTTR = Level of Travel Time Reliability. Segments with an LOTTR ≥ 1.50 are considered not reliable.
TTTR = Truck Travel Time Reliability.

Appendix C – Delay, Reliability and Truck Data

Total Delay = [(Average Travel Time – Free Flow Travel Time) x Volume], summed for each 15-minute interval during the peak period.
LOTTR = Level of Travel Time Reliability. Segments with an LOTTR ≥ 1.50 are considered not reliable.
TTTR = Truck Travel Time Reliability.

Appendix C – Delay, Reliability and Truck Data

Total Delay = [(Average Travel Time – Free Flow Travel Time) x Volume], summed for each 15-minute interval during the peak period.
LOTTR = Level of Travel Time Reliability. Segments with an LOTTR ≥ 1.50 are considered not reliable.
TTTR = Truck Travel Time Reliability.
